No, Scott. The components stay on the board because the flux in the
solder paste is real sticky!

Paul

I don't use paste...just regular "no clean" solder.  But then again, I'm
a masochist ;)

I have two NEC 536300 relays for sale. The specs are:

50 ohms input and output
150 Watts to 470 MHz
VSWR 1.25:1
Crosstalk 40 dB
12 VDC coil
Shown in August 1965 VHFer if you still have it. I don't.

They can be viewed at:

http://home.comcast.net/~hsknoll/site/?/photos/&PHPSESSID=29ec62ea0bf1fe4d25e318b011cf0bbf

or

http://tinyurl.com/yktwxpz   click on photo to enlarge it.

I'm asking $10 each plus shipping.

===
I have a Heath HM-2102 VHF SWR meter 50-160 MHz
0-25 and 0-250 watts. Very good condition.

I'm *asking* $40 plus shipping.

It can be viewed at:

http://home.comcast.net/~hsknoll/site/?/photos/
&PHPSESSID=29ec62ea0bf1fe4d25e318b011cf0bbf

or

http://tinyurl.com/yktwxpz   click on photo to enlarge it.

We need gravity to keep from floating away when we fall.

Hey OM:

Yes Fritz you got something there. I knew something was amiss after I found out that George Washington we were taught in school was the first president, wasn't really the first president, they'd been teaching me a lie for so many many years.

But I did my research the earth is flat. The United Nations LOGO proves it. The UN logo is the flat earth. It's all just an illusion that the earth is a spheriod and they have all the math and physics to prove it is spheriod.

It all goes with the saying: figures can lie and liers can figure.

Hey OM:

In the ole NTSC days gone bye, that's how they detected the video signal in the last of the ole NTSC TV's, took the SAW filtered IF and squeezed the video out by converting the RF right to video baseband, with the carrier as an LO OSC all inside one little tiny IC

I just never new what happened to the frequencies that were below ZERO from the mixer.

Thanks Graeme,
I'm thinking about building the mixer that was in QST Feb., 1993, an article by
Jacob Makhinson. Titled, "A High-Dynamic-Range MF/HF Receiver Front End"
The mixer uses a quad FET IC, (Si8901 from Calolgic corp.)
The only online reference that I can find is here; See pdf pages 26 (text)
27 (schematic)
http://files.bluecrow.net/Amateur%20Radio/arrl_handbook_2007/11.pdf
The front end is designed in three modules, preamp, mixer, and post amp.
Anyway I'm thinking about building the mixer and playing with it in the
AMBCB.
Even thoughts about building an I/Q receiver.
Mike
(Note; I do more thinking than building ;-)

Google around for "H-mode mixer" and "Tayloe mixer" if you want more
information. http://www.webalice.it/romano.cartoceti/h-mode_links.htm
will get you started with *many* links to investigate.

There has been a lot of interest in this sort of switching mixer topology in recent years... quite a few articles in QEX for example. Many designs have come out, some of which are based on general-purpose multi-FET parts such as you suggest, and others which are based on CMOS "fast bus switching" ICs, such as the FST3125 and similar. This seems to be a very good topology for handing signals having a very wide dynamic range... I believe that Elecraft uses a design of this sort in their K3 transceiver.

Yeah, I've been toying with that sort of idea too... making a "binaural" direct-conversion receiver. There was a binaural design published in QST a year or so ago, which uses the NE602 or similar Gilbert-cell mixers... building one which uses H-mode switching mixers and a couple of low-noise audio amplifying chains could be fun.

You should look at the Northern Radio Model N570/571 Marine SSB Radios, that were designed and built back in the Early 70's. They used at rather unique design with a Double Balanced Mixer at the Receive Antenna Port, that moved the IF up to a low VHF biDirectional Amp and Filter, and then back down to a 10.7 Mhz IF with another Double Balanced Mixer, and on to the Crystal SSB Filter, and Demodulator. The Double Balanced Mixers were driven by an LO System that canceled out any Frequency Drift, by using opposite Mixing Images.

Hi all

As titled. I have just got one out of my stock of parts and have no data.

It was bought 15 odd years ago and, sadly, any data with it seems to have gone with the wind. There appears to be no online reference or data for the item in the SBL-1-X series, so no doubt it's obsolete.

I am just about to use it for a non-critical application, but wonder if it differs markedly from the usual SBl-1's? I would hate to badly under drive it, or worse, use it as an expensive fuse!

The part is marked:

        MCL SBL-1-8
        915215

Does any kind soul have an old catalogue or data sheet, or even the info at their finger tips.... or has even heard of them?

Just looking for the headline differences, please, if possible, thank you.

John

Thanks for your link, but I have already been to that and others, as indicated. No joy on the dash1 dash8 flavour; that includes MiniCircuits own current database. Hence my post.....

Hey OM

Did you try the WAYBACK MACHINE?

Go to http://archive.org
and type in www.minicircuits.com in the WAYBACK MACHINE

and go back a few years

The Application Data is still archived back to 1997.

Thanks all.  I got feedback from MCL.  Treat electrically as an SRA-1-1.
And from memory and from another NG, 0.1 to 200 MHz @ +7dBm LO
injection.

Hey OM:

From the miniciruits.com app notes archive in 1999 i found this:

6. LO DRIVE.
The LO drive is critical since the function of the LO drive is to switch the mixer diodes fully on and off for lowest distortion. So, for optimum performance, select the mixer level to match the LO drive. Mini-Circuits conveniently identifies its mixer levels by the LO drive requirement; thus a Level 7 mixer refers to a LO drive level of +7 dBm. If there are constraints on the LO power available, select the lowest level mixer closest to the available LO power. For example, if +12 dBm LO drive is available, select a Level 10 mixer.

73 OM

I have built several Softrock kits and have no inclination to use any
other receiver as a result. It's a receiver from heaven.

Looking at yours and the simple block diagram I am curious about how
this differs from quadrature processing.

Can you provide a few words of explanation.

Jack K9act

Hi Jack,

> Looking at yours and the simple block diagram I am curious about how this
> differs from quadrature processing.

I'm not sure I understand your question.

As the diagrams show, the VFO is divided by four to produce 90deg quadrature LO signals which drive two mixers.The two audio channels pass through two BPF filters, one of which has a Gilbert transform to give 90 deg delay. It's the standard Phasing Method..

If you're asking about Binaural reception, it's the same as above, but less the Hilbert transform so there's no sideband suppression..

Admittedly that page is somewhat condensed (simplified) over the original.

Regards .... Zim VK3GJZ

I was given a used HP54100A scope. It seems to work, but I'm still
trying to figure out how to use it. Seems to be able to display and
measure frequency output of my grid dip meter up to 200MHz, I think this
unit is good to 300-500MHz? Anybody ever use one of these before? Also
I only have the 50 ohm input modules, I understand a 1Meg ohm input can
be had with the 54003A, any ideas what those would cost?
(I think this scope was made up until the late '80's or early '90's.

Hey OM

This thread begs the questions:
What about SSB and CW? Would syncro conversion detect just the upper
sideband?
Because the lower sideband would be below ZERO hertz?
If you use a BFO how do you get below ZERO hertz?
Doesn't the Fourier transformation of the mixers' LO and rf input in
a syncro conversion produce frequencies below ZERO?

No. You can select either sideband.
Just change the sign when you combine the I and Q signals.

this is a fairly simple intro.

It is not possible to use synchronous detection with SSB or CW because
there is no carrier in the signal.  So the circuit that recovers the
carrier will work on the modulation and the result is unusable.
(i.e. no audible modulation with SSB, and at best a 0Hz tone with CW)

There are no frequencies below zero.  When you are using only a single
mixer, both sidebands will produce frequencies above zero.  And there
will be no suppression of the "unwanted" sideband.
(the synchronous AM detector is a dual-sideband detector)

Hey OM:

I beg to differ there are frequencies below ZERO hertz you are just
not aware of them.

Simply put the frequencies add and subtract, towit below ZERO. When
mixing frequencies they add and subtract there is no doubt about it.
So it must be for all cases.

If I take 2 frequencies and mix them I get the Sum and the Difference
of those frequencies plus the original frequencies. NO?

Tell me this is wrong?

Because that is what you have just told me?

> the synchronous AM detector is a dual-sideband detector

Some are, some aren't.

My Sony ICF-SW7600GR lets you select sidebands while in Synchro mode,
as does my homebrew DSP RX.

Selecting sideband in AM mode is most useful.

> not aware of them.

Because the "frequencies below zero" will come out of a single mixer
as equal frequencies above zero.  Only the phase is different.  So
when you use two mixers and quadrature signals, it is possible to
select a sideband.  But with a single mixer and synchronous detection,
this is not possible.

Ok it can be done but not with the circuit described in this thread
and on the referenced site.

You need two mixers and 90deg phase shifts to do it.

We are wholesaler of Watches in China. We are big Watches Manufacturer
in China. We wholesale Watches Rolex, we can offer series of brand
Watches with the lowest price and high quality,
Our feature are
1) Good materials
2) Excellent service
3) Factory price
4) Good quality
5) No limit of min order quantity.
6) Safe payment (paypal, T/T, WU, Moneygram)
7)Fast and safe shipment and good policy ???Shipping day: 5-7 days???
8)Much discount than others
9)No min order u can buy only one and we ship door to door.
10)Faithful and reputation
We are looking forward to cooperating with old and new customers.
Please contact us at any time and kindly visit our products catalog

Hey OM:

The ole TV systems that used NTSC type signals, the video is Vestigial
Sideband.
So if what you say is TRUE then I never ever would have seen anything
on an NTSC tv but the low frequencies that are present in NTSC signal
part of the lower sideband.
All the now defunked, latest NTSC tv's used synchro' detection on the
Vistigial Sidband video.

 I made a living repairing those old NTSC tv's that had synchro'
detection of the Vestigial Sideband video.

73 OM

In those TVs, the selection of the sideband is not done by the detector
but by an IF filter that passes only the frequencies of interest.

I did not say the synchronous detector cannot demodulate a single sideband,
I said it cannot select the sideband. So if you pass both sidebands
to the detector, it will demodulate both of them. Unless you use a
quadrature approach.

(and it cannot demodulate SSB because there is no carrier. in TV VSB
there is a carrier present that can be used to control the synchronous
detector)

Hi all...

About 6 months ago we had a storm that blew up my FT-897D transceiver... In short it cooked the microphone circuitry and one of the DDS chips (the one that does carrier sidetone) but miraculously, the finals still seem okay as a strong unmodulated carrier is still produced when attempting to transmit FM.

The set has been replaced on insurance, but I'm looking at the old one as a source of parts for a possible homebrew transceiver project. The plan is to recycle this set, using the remaining good parts and design a new radio using the existing chassis. Why completely DIY? Most SDR kits seem to be made of unobtainium from my prospective ... highly expensive and/or not available directly in this country (which means lots of running around financially... I don't have PayPal or a credit card, and refuse to get either).

At present, I've been looking at the BeagleBoard[1] which is a small embedded Linux computer, measuring 3" square. It incorporates a 600MHz TI OMAP CPU with integrated DSP, apparently the latter is capable of processing HD video, so I'd imagine SDR would not be a particularly demanding task. Minikits also sell a DDS kit[2] which I'm thinking of utilising in the frontend to act as an I/Q upconverter/ downconverter.

In receive, the signal would be downconverted to some low IF in the range of the onboard audio CODEC, then that demodulated by the onboard DSP and passed out to a headset (either wired to the CODEC, or maybe USB audio). On transmit, the incoming audio would get baseband-modulated by the DSP, then upconverted.

The exact specifics are still on the drawing board (quite literally), but I'm curious about a few things...

Speaking with Minikits, there was a remark made that mixer's apparently like square wave inputs... I was initially planning that the output from any DDS would have to be passed through a suitable PLL to clean it up and come out with a nice sine. I'm not doubting there's possible wisdom in this other approach, just having trouble understanding how it works in theory, as I understand square waves to be very rich in harmonics, and therefore would surely cause undesirable behaviour in a product detector or AM modulator...

In the future I'll probably use a proper ADC and DAC as the RF input and output to the DSP, but this is pending me figuring out a good way to produce PCBs with the fine trackwork required and means of soldering such small components (the oven here only goes to 250=B0C). Hence why the initial phase will probably use the existing audio CODEC (which should be good for 48kHz sample rates).

One characteristic of such devices however; is aliasing... on the ADC, such a filter is usually intended to select the 0-=BDFs frequency range... and on the DAC, a reconstruction filter does likewise. I'm wondering whether this aliasling phenoma couldn't be used to sample the spectrum in =BDFs Hz chunks using band-pass filters tuned at some harmonic of Fs? Likewise for the DAC, its output apparently contains duplicate replicas of the baseband signal... has anyone tried using a reconstruction filter tuned at a harmonic of Fs to select one of these images?

As for the upconverter/downconverter... the thing that concerns me is image rejection. Most of the DDS chips quite easily handle 0-30MHz, and so there I'll probably do it direct-conversion into the CODEC or ADC. However, for 6m, 2m, and 70cm... if the DDS goes up to 30MHz, then it seems the sensible thing to do is to use an IF to downconvert that to the 0-30MHz range. One of the DDS kits I'm looking at uses a 100MHz clock, so it seems sensible to use that to generate the IF frequencies as well... The dillema is whether to use sideband cancellation (Hartley modulator) or to use band-pass filters?

IF frequencies: starting at 100MHz, I can divide that by two, then triple to get 150MHz (for 2m IF) and triple again to get 450MHz IF (for 70cm and UHF CB). For 6m, I simply take the 50MHz divided source, and divide by two again to get 25MHz.

From there:
50-54MHz: IF at 25MHz... tune the DDS between 25~29 MHz, use a 50MHz high-pass filter on input to receiver to reject <25MHz image
144-148MHz: IF at 150MHz... tune the DDS between 2~6 MHz, use a 150MHz low-pass filter on input to receiver to reject >150MHz image (might be a bit tight)
420-450MHz: IF at 450MHz... tune DDS between 0-30MHz, use 450MHz low-pass filter to reject >450MHz image (probably much too tight)
476-478MHz: IF at 450MHz... tune DDS between 26~28 MHz, use 450MHz high-pass filter to reject <450MHz image

The two dilemmas I face here:
- If I use the conventional method, how does one go about desigining
the filters with the cutoff required? Some of them are quite tight.
I might have to re-think the IF frequencies for a couple... but I'd be
interested to know how others achieve this.
- The alternative is to use sideband cancellation to select the 30MHz
above or below the IF. This will require a Hilbert transform filter
with quite a wide bandwidth... Is this doable or sane?

Regards,
Stuart Longland (VK4MSL)

I wish I could offer a few half-baked ideas to stoke up your imagination. But I have to admit, you are too close to the leading edge for me to offer anything constructive.   There are people out there who could offer some constructive ideas, but there aren't that many. And any more, I suspect some of those fellows use Japanese or Chinese as a first language.

How times change...

Brian W

To whom it may concern,

I had been an electrical engineer and computer programmer who has now been jobless for five years now.

I find it extremely ironic that the very hobby which helped me escape from an abusive family is now a place where nobody really cares.

I hear it on the HF bands. On the low side, people are keying down left and right without even identifying themselves or even bothering to check if people are calling CQ first. On the high side, I hear lots of obscenities, lots of crude speech, and lots of Tea Party monologues.

CQ and 73 magazines have folded. There are very seldom any new building projects on QST. The USENET groups for ham radio are pretty much flooded with porn.

Where have all the people gone?

If there's anyone left who is interested: I have a 100 Mhz analogue scope, several antique signal generators, a circa 1950's analogue signal analyzer, an FT101EE transceiver, and about 50 pounds of electronic components and samples.

I'm ready to walk away from my hobby for $1000. I'm willing to do it now rather than wait for my family to attempt to conduct an estate sale for pennies on the dollar.

Anyone interested please contact me here and we'll exchange email
addresses.

The Eternal Squire

I think you may be coloring what you see with what you are used to.

Things have gotten worse over the years, but may not be that bad.

Unfortunately, there are two kinds of people in the word, makers and users.
Makers build things and really can't stop thinking about making things,
tweaking things, etc.

Most people don't build things but use them. Some understand how and why they
work, but most don't.

When I was a young child, (1960's) if you were interested in technology, you had to be interested in ham radio. I spent most of the 1960s reading two ARRL handbooks (one from the 1940's and one from the 1950's) over and over again, drooling over the ads, etc until they fell apart.

Unable to learn morse code, I gravitated twoard photography, which still had "the magic", but did not require anything except light, film and some chemicals. I made my first enlarger, developing trays and an (un)safelight.

By 1969 I had been exposed to computers and was working on them. Ham radio became a forgotten thing, although I had a shortwave radio from when I was about 12 or 13 when I found a portable radio that had been dropped and was in the trash. All of the plastic IF transformers had sheared off at the base, but they still were connected and it worked.

By 1971 when I graduated high school, everyone in the school had some exposure to computers. One high school (not mine) had a PDP-8, which the PTA bought (cost was close to a house then).

So the users moved away from radio twoard computers. It wasn't another 7 or 8 years before home computers started on the market, and by 1980 the makers could go into a computer store, buy parts and make a computer.

The Apple One started out as a bare board you could get the specs from at a club meeting.

You see it here in Israel, where there are tests for tech and general twice a year, and a Morse code test is still required for HF. The tech and general written are the same. The last written test was announced a week before it was given, and it was the same time as the final exams in every university.

So while there may have 10-15 prospective new hams only 5 or so could show up for the exams and not all passed.

On the other hand, you can go into any mall and walk out with a computer, almost day or night. No license, no exam, and a lot less money than even a cheap HT here. You can have a 15 megabit aDSL line in a day.

So unfortunately most of that talent has gone elsewhere and most of it will never come back.

:-(

The average age of hams everywhere is over 50, and it unfortunately is a dying hobby.

>
> I hear it on the HF bands. On the low side, people are keying down
> left and right without even identifying themselves or even bothering
> to check if people are calling CQ first.

That's caused IMHO by two things. The first is preventable, many hams now use autotuners and literally can't hear anything until they transmit, which causes the tuners to "work". By that time, the damage is done.

The second is the lousy propigation. I am right in the middle of the reach of signals from of the former Soviet Union, which had a very active ham community (it was treated as a sport with all the perks) and still does, and western Europe which is far less active than it used to be.

There are still plenty of Italian hams calling CQ forever (persistance pays in bad propigation), polite Germans and Austrians, and the occasional French or Brittish ham.

The problem is that they can not hear each other. 80 and 40 meters are burried in noise these days, even in the dead of winter they were nothing like they were 10 years ago, and the higher bands are open across Europe or farther for a short time each day.

Since the distances are the same, I expect the same thing happens in the US. A ham in New York can be happily in conversation with a ham in Florida, and someone on the west coast can tune up, listen and not hear them.

Meanwhile, a ham in Chicago may hear both.

Proprigation is not always 2 way, depending upon who has the better antennas, better receivers, less noise and more power, sometimes one side will be heard, while the other won't.

I often have s7 to s9 noise here on the low bands (sometimes as high as 20m), and so a perfectly readably s5 signal is lost to me. (today is an s9+ on 20m day)

> On the high side, I hear
> lots of obscenities, lots of crude speech, and lots of Tea Party
> monologues.

That is unfortunate. Nothing I or you can do about that, except to move to another frequency.

It's really become a case if "someone calls CQ on a band no one is listening to does it matter"? (the old if a tree falls analogy).

Start listening on 15 meters, and 10 meters, if your radio can do it and you are in the US, start working 60meters. If you prefer CW try 30 meters.

If you have a modern rig that does 2m or 6m SSB, build an antenna (a 6m dipole will work for a while), or a 2m beam, and start calling CQ on the low end of the bands.

Let people know you are there and they will come to you. Post here for the lower bands, join one of the more policed mailing lists, or just announce on a local repeater.

> CQ and 73 magazines have folded.

I never understood how 73 stayed in business after Wayne Green started talking about curing AIDS. Needless to say, he did not and alienated a lot of hams.

CQ is gone? Oh well, you see how often read it. I recently found their 50th anniversary issue and enjoyed reading it again. But like everything in print, we don't buy much of it anymore. Only the Friday paper (our equivalent of Sunday's in the US) and only for the ads.

> There are very seldom any new building projects on QST.

That's because no one builds anything anymore. If you are interested in such things, look around for websites and mailing lists about building things.

If just building things non radio related, interests you check out MAKE: (with a colon at the end) magazine. It may be too simplistic for you, it may not.

> The USENET groups for ham radio are pretty much flooded with porn.

No, your newsreader's filters are broken. I read around 20 groups a day and with judicious killfiling, see less than 1 porn message a day.

Youre real problem is that you drank the Google Kool-Aid. The worst thing that ever happened to USENET was "Google Groups". Just like their $150 million dollar investment in BPL almost killed ham radio, their opening of Google Groups, where anyone can post anything and often does, with no killfiling has almost killed USENET.

Get a decent newsreader and move to eternalseptember.org. You may actually enjoy USENET again.

> Where have all the people gone?

Real USENET, moderated (or monitored) mailing lists (many on yahoo), the less populated bands and so on. And unfortunately many of the hams I knew when I was first licensed (1993) are silent keys.

> If there's anyone left who is interested: I have a 100 Mhz analogue
> scope, several antique signal generators, a circa 1950's analogue
> signal analyzer, an FT101EE transceiver, and about 50 pounds of
> electronic components and samples.

Stick em in a box and mail them to me at your expense and I'll take them.

Expect someone to pay for them? Do you know a museum of 1970's technology?

Seriously, the FT101EE is worth about $100 "untested", $150-$200 if it works and $300-450 if it has been recapped, retubed, tuned and tweaked.

You might get $50 for the scope if it is a TEK or pre-Agilent HP. If it's so old it has tubes (besides the CRT), it will need to be recapped unless you sell it as a project.

IMHO the best thing to do is to get on 2m if there is any action near you, and find a new ham who wants a "project". Give it all to him (unfortunately it's a 99% probablility it's a he) gratis.

Just don't be surprised if in a couple of months he gives up and sells it all on eBay, or offers to give it away. New tubes, replacement caps, etc are expensive and it's a lot of work.

> I'm ready to walk away from my hobby for $1000. I'm willing to do it
> now rather than wait for my family to attempt to conduct an estate
> sale for pennies on the dollar.

More likely, it will just end up in the trash. Unless your survivors know any hams, no one will even want to come and take it away.

Geoff.

Sorry you feel this way. I just recently obtained my tech, general, and extra tickets, and I am excited about getting on HF, althogh I don't have any HF gear yet. I actively particiate in the D-STAR mode thorugh local repeaters.

Locally, we have several youngsters (i.e. grade schoolers) who have become interested and obtained their licenses; it's great to hear them talking on the air.

Not sure why you think CQ magazine folded...it seems to be alive.

  HI,

If all the people interested in radio and building things are gone, then
how come I am facing stiff competition on Ebay when I wanted to bid for
87V Fluke meter, a HP8640B signal generator or even a small FT010 or
TS520 VFO?

hello all,   does anyone know if my icom 7400 txvr., bought new in jan.
2004, circuit boards were
assembled using `lead free` solder,or leaded solder,and can leaded
solder be used to repair or
replace parts even if original assembly was `lead free` The sevice
manual doesn`t mention this,
and tried Googling for info. with no success !

thanks for any info.   doug.

There ARE people who write mean notes just because they can. But this
isn't one of that brand - it sounds too coldly realistic. Sad.

When I was a kid, 3 gigahertz and 10 gigahertz were radar bands.
Magnetron and klystron territory.
  Now I can buy a PC that runs at 2.6 GHz

  Used to be, I could wait thirty seconds for Google to open.
Now I see MATLAB open inside 2 seconds - and that's over 2 GB of code....

  If I want a tech project, I can buy a reasonably fast Arduino
processor board for about $30, and get all kind of software applications
for it, and all kind of hardware add ons - gyros accelerometers, thermal
sensors, motors, relay and triac drives
  - the whole ball of wax

Doug-

Circuit boards that contain surface-mount components most likely were made with lead-free solder. Lead can combine with silver used to connect to the components. The resulting amalgam can cause bad electrical connections.

If the circuit boards had nothing but components with wire leads, then it probably wouldn't matter. I doubt this is the case, however.

Fred, thanks for info.  The radio is all surface mount stuff, so as
you say,likely
lead free. Will need to give it more thought !    73    Doug  GM3OAV

Judging by your equipment you are probably as old as I am!
I have found that you can find whatever you look for.
Equipment is better and more available than ever. There seems to be an unending supply of really nice and knowledgable people to talk to on both Ham radio and the internet. I have access to information at my finger tips and the diverse opinions of experts on nearly any subject that I choose any time!

It astounds me that there are so many folks who are so kind and generous when they find someone who shares their interests. I find it fun to do the same with those that I can help!

I bought an incomplete home brew project at a hamfest a while back that was a near perfect match for a project that I wanted to build. I thanked the fellow and complimented him on his work. He then dropped the prices on much of the rest of his table. He also gathered up some things I had shown an interest in and insisted I give the a good home!

There are some really nice people out there but you have to give them a chance!

I have found that there are plenty of Hams on 160, 80, 40 and 2 meters that I really don't care to talk to. No problem, I just move on, they are not going to rain on my parade. I consider them just part of the noise and easy enough to filter out of my world.

Hang onto your scope, it is probably as good as anything available on Ebay or elsewhere. Since you have that, I expect you can build. Get interested in small projects with micro processors & such. Parts are cheap and you can keep a whole workshop in a fishing tackle box!

You probably love that FT101, but you really need to experience a little of the modern stuff! These itty-bitty modern radios are pain to see and operate but plug one into your computer with an inexpensive (or free!) control program and you can operate from your computer!
I passed my FT301's along awhile back and have not missed them. I am currently using a Ten Tec Jupiter and lusting for an Omnii 7.

Usenet is in a lull at the moment but like sunspots, it will be back stronger than ever because of its freedom. All the advertising and porn will remain but just consider it noise. We can work through the noise!

I am leaving instructions that anything that is in my estate that is not useful to my heirs is to be taken to a Hamfest and sold for whatever is offerred or just given away. Nothing to the landfill please! Some of it will find a good home I hope!

I discovered BPSK31 last February and I want to get a 40M antenna into the mix for my MultiBand Fan-Sloper today (maybe 80M too!) as well as assemble a new computer for a church project today. It will be a very busy and fun day!

It is a great time for an old Nerd/Egghead/Techie/Geek to be living!

73, and may the force be with you,

I was watching a YouTube video of someone demoing a Kenwood TS-830 he was selling. One of the comments was from someone who noticed price tags on all the equipment near it.

The ham selling the rig said that he put price tags on ALL of his gear so that when the time came for it to be sold off at an estate sale, the people doing it knew what to sell it for.

On the flip side someone here had imported at great expense from the US all the old ham radios her father had lovingly used until he died.

A friend of mine went to take them and said all that was there was trash. The only thing he was able to salvage a J-38 key that was too dirty to use.

Everything of value had been sold off before he died.

Good thing, someone else called her and convinced her to let him get first crack at the stuff because he was an upstanding religeous guy and was going

to help relgious students, etc . Gave her a phoney ham call too. He took
one look at the stuff and walked out.

Geoff.

I'm not even all that terribly old.   I just turned 48.   But now I
feel terribly alone.

One of the main problems I have is that I have grown up with autism,
depression,
and child abuse. And since it simply wasn't done back in those days
to tattle on
my father to the police for beating his wife and children, ham radio
was my escape
from all that.

Ham radio was also my doorway to a good career as a software designer, and to an honorable way out of leaving my family for good. But not before both my mother and my sister died from suicide while I was still in college. I tried having girlfriends before I married but not one of those relationships lasted beyond a few months. I also married twice. My first marriage ended because my ex was as mentally ill as I was, and wanted me to take an overdose of pills with her. I had to walk away from that marriage when that happened.

I spent a lot of years being a complete social inept while being very good at the workplace for a total of 15 years, with lots of breaks between those jobs for being encouraged to resign for lack of social skills. I've spent a lot of time with shrinks, and taken lots of different medications. But none of these things were nearly as effective as simply being busy and focused on a project at work, where for at least a few hours a day I felt like I had some worth and could temporarily ignore both my loneliness and my constant background thoughts about ending my life.

I was last employed in 2005, after a huge layoff where the company lost a third of its people after a top level takeover. The company had been a very nice place to work, and it was while working there that I had the confidence to marry again and this time start a family. My wife and I reversed roles and so I supported her career, because I have not been able to find work since, in or out of my field. The usual answer I got at interviews since the layoff, was "We believe your skills are outstanding but we have this 'gut feeling' you would not fit it with our team."

But that's the whole point, you see. I compensated for not being able to fit with people by becoming extremely competent at what I did for a living. In the older days you could get harassed for being unable to relate with other people well but at least they would recognize talent and hard work and the willingness to take on the most difficult possible assignments and hire people for accomplishment. Now they don't do that, because teamwork and service are everything, and expertise is now something they buy off the shelf from Bangalore or Bejing.

At this point in my life I don't believe I will change, because it means I would have to become something I haven't been and never was. And by now, I have found that I don't really like or trust most people... because I had been hurt or ignored too much by them. I'm really only close with my wife and my daughter.

I've been unemployed for five years now. The first two years I had been busy raising my daughter to school age, no time for hobbies and radio then. The next three years had been a rather painful search not just for working, but also for a new working identity.
I used unemployment money to buy a tabletop CNC milling machine by way of adding a new skill set. I also started teaching myself how to hammer and shape silver, and to collect and shape and polish rocks... because now that I am denied an engineering career I thought to become a jeweler using my engineering skills as a starting point.

There's a lot of possibilities for things I could do or make, but I'm paralyzed at trying to follow up on any of them. So I do nothing very intensely anymore. I don't want to stake much of myself on attempting something and then having my work or myself rejected again.

So here I am, a complete waste of training, cooking and washing dishes, playing mad scientist, and waiting for a better day.

The Eternal Squire

That's your problem in a nutshell. It's not ham radio it's you. You've metaphoricaly fallen off the horse and refuse to get back in the saddle.

It's a common part of depression and a common effect of being laid off or retiring.

You need (at least IMHO) to accept the fact that you are going to fail, most of the time and do things. Most people see start-ups making big bucks on the news, but have no clue that the failure rate is about 95%. 75% in the first year, Here in Israel, about 1/2 to 2/3 fail before they exist on paper and anyone knew they were even "there", so they don't count in the published figures.

I have no information about the US, but what I know from people in silly valley, that's about right there too.

> So here I am, a complete waste of training, cooking and washing dishes,
> playing mad scientist, and waiting for a better day.

There you go. Better days are not going to come look for you, you have to keep looking for them.

As I said before, move to a different band if you don't like the hams on the one you are on. Look for different ways to use your skills, market yourself etc.

For example, can you build prototypes? Inventors are everywhere looking for people to build their demo unit to raise funds. You could build one for cost of materials and enough extra cash to offset your time and effort, plus a small "cut of the action".

It's not going to pay well, but if you do one a month for two years, there is a good chance that one of them will pay off, and far more than if you had charged "full price" to the other 23.

Since you have experience in software development, radio and metalworking, maybe you can combine them all into a niche market within prototype design.

The better days are out there, and they need you, but you have to go find them yourself.

BTW, are by any chance, you, your wife, or are/were any of the 8 grandparents between you Jewish? If yes, you are entitled to Israeli citizenship, relocation and "absorption" assistance.

It would be a real uphill battle and a "kick in the pants", but it may be exactly what you need.

Or if the same question applies to being Irish, they also have a "law of return", but I know nothing more.

Geoff.

No need to wonder. Heat up a soldering iron so it will melt some tin/lead wire solder. Small 63/37 will work best. Find a place on a board where you can get an iron onto the solder on the board. See if you can add a tiny bit of leaded solder to what is on the board. If it melts and joins the board solder, then your radio uses leaded solder. If the board solder will not melt to join your leaded solder, then the radio was built with lead free solder.

Since lead free devices were first required in the EU on July 2006, lead free solder certainly was not a requirement. Asian countries followed the EU by a year or so.

Another clue is if the insulated wiring in your radio uses PVC insulation. Lead compounds are used to keep the insulation flexible and would probably not have been used in a lead-free device. Also look for tinned wires. Lead-free will use silver plating and probably teflon insulation.

Also look at the connectors to see if they are tinned rather than gold flashed. Another good clue.

Lead solder can certainly be used to repair a lead free solder connection. The problem is in getting the lead-free solder hot enough to melt with a common soldering iron. If you are removing/.replacing a SMT component on a circuit board, the usual method is to just clip the leads, if possible, then use a suitable soldering iron to clean up the pads. Then use your leaded solder to place the new component. If you have some solder paste, use that on the pads before placing the new component, but you can use thin wire solder just a well.

Be sure to clean off all the flux.

Good luck
Paul, KD7HB

```

The fact that you are following a Newsgroup on Homebrew electronics indicates you are different than most of the rest of the world. You are here with a group other odd folks. We are not "normal" in the eyes of the average population. We accept being different and enjoy it!

What you would prefer to do in life and what is available for you to do not appear to be the same thing. Most people do not find the work that supports themselves and their families less than their first choice. Were I in your position, I would seek gainful employment in whatever I could do and tolerate. If gainful employment is not to be had, there a lot of volunteer jobs that may lead to a better life.

If you don't expect much from other people you will appreciate those that surprise you! The life that is behind you is not nearly as important as that which is in front of you.

Association with some religious group is better than none and as Geoffrey indicated, there are benefits that come with belonging.

You say: "So here I am, a complete waste of training, cooking and washing dishes, playing mad scientist, and waiting for a better day." Lots of us old retired guys live the same life and enjoy it. Since we retired I consider myself a "House husband". I send my wife and her sister off on trips & cruises while I enjoy staying home and tending to the dog & cat. I had more than enough travel while I was working!

When she completes her Chemotherapy I don't intend to change a thing, I enjoy my cluttered life just as it is...

I can tell you the world is not going to change to meet your wants but you can alter your approach to life and find a comfortable and friendly spot to be. If you choose to be happy, you can make it happen. If you choose to be miserable, you can be miserable.
I gotta go now, today I am assembling a computer for the church and I have a model airplane that needs attention. I did not get to the antenna work I had planned yesterday... I really need to mop the kitchen too...
Life is great for us Nerds today!
May the force be with you and God Bless...

Sounds like you need to switch to contesting and/or DXing, preferably using
CW.

That way you don't actually have to talk to anyone.

Great advice IMHO. I sincerely hope you are able to find your niche.
If you want to work again, I can tell you that there are some kind and
understanding interviewers out there, though I'll admit they may be a
bit rare. I've been known to spend the first 30 minutes of the
interview chatting about the weather, baseball or whatever just to allow
an obviously nervous or ill at ease applicant time to get to a level of
comfort where the "real" interview could begin. I'm sure I'm not the
only one. Gotta go do some laundry now. :-)
Blessings,
Charlie C.

��  It seems to me that crude speech and ad hominems often comes from
those who did not get enough one-on-one attention from an adult
care-provider during their early years.

BPSK31 is usually that waqy too! A few canned macros chain together to
maake a QSO. I have had some very enjoyable rag chews though.

At this point in your life what do you consider fun. I know I have a
number of varied interest but at one time I was very much centered on
amateur radio and before that hi fidelity ,photography and quite a

large number of other interest. Each became boring after a while as I centered on one at a time. Today I am interested in just about all of those hobbies and others because there is no central all consuming one.

Jimmie

Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may

still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

Hello,

A while ago in RadCom there was a circuit diagram for a power supply on-off switch which allowed a large current load to be switched on and off using a small push button switch. The circuit used a relay which was switched on by the push button which was across the relay contacts. I can't find the circuit diagram anywhere. Could someone please send me the diagram.

Hi John, If the pushbutton was across relay contacts it must be a
momentary contact type, and you would need a second pushbutton in
series with the first one to drop out the relay (turn off). This
scheme is used often in motor starter controls where one switch is
"start" and the other is"stop". You could use a push-on push-off
pushbutton and wire it in series with the relay coil, and just use one
switch.

I have a 100amp power supply and I use an automotive starter relay
used in a latching circuit with a NO momentary push-button used for
connecting and a NC push-button used to disconnect. One advantage,
maybe disadvantage to this circuit is that it turns itself off with
power bumps.

=========================
Haven't seen the referred circuit diagramme.
But if the relay coil is nominally 12V-DC ,the push button (make) 'on'
switch is at 230/115 AC parallel with a relay NO contact ,in series with
the AC supply to the transformer and relay coil is in series with the
push button 'off' switch connected to the say 13.8V-DC output .
If 'on' switch is pushed, AC power is fed to transformer --> when there
is a DC output the relay energises ----> the NO relay contact in the AC
power line closes and the 'on' pushbutton can be released
If the 'off' switch is pushed (break contact) the relay is de-energised
and AC power is removed since the relay contact in the AC power line opens.

If there is a power bump ,the charged elcos in the PSU will prevent the
relay to de-energise immediately.

All this of course is valid for a PSU with a DC output of 13.8 V
A say 24 V-DC PSU would need a relay with a 24 V coil.

For an increased duration power bump protection a lower voltage relay
coil can be used in series with a suitable resistor and a suitable elco
introducing a time delay . For immediate shutdown the 'off' switch
should be in series with the relay coil NOT including the elco connection.

The advantage of having the relay coil at PSU output level is that in
the event of an internal fuse blowing (through for example a crowbar
over-voltage protection system) the AC power to the transformer will
also be removed .

> About 6 months ago we had a storm that blew up my FT-897D transceiver... In short it cooked the microphone circuitry and one of the DDS chips (the one that does carrier sidetone) but miraculously, the finals still seem okay as a strong unmodulated carrier is still produced when attempting to transmit FM.
>
> The set has been replaced on insurance, but I'm looking at the old one as a source of parts for a possible homebrew transceiver project. The plan is to recycle this set, using the remaining good parts and design a new radio using the existing chassis. Why completely DIY? Most SDR kits seem to be made of unobtainium from my prospective ... highly expensive and/or not available directly in this country (which means lots of running around financially... I don't have PayPal or a credit card, and refuse to get either).
>
> At present, I'vze been looking at the BeagleBoard[1] which is a small embedded Linux computer, measuring 3" square. It incorporates a 600MHz TI OMAP CPU with integrated DSP, apparently the latter is capable of processing HD video, so I'd imagine SDR would not be a particularly demanding task. Minikits also sell a DDS kit[2] which I'm thinking of utilising in the frontend to act as an I/Q upconverter/downconverter.
>
> In receive, the signal would be downconverted to some low IF in the range of the onboard audio CODEC, then that demodulated by the onboard zDSP and passed out to a headset (either wired to the CODEC, or maybe USB audio). On transmit, the incoming audio would get baseband-modulated by the DSP, then upconverted.
>
> The exact specifics are still on the drawing board (quite literally), but I'm curious about a few things...
>
> Speaking with Minikits, there was a remark made that mixer's apparently like square wave inputs... I was initially planning that the output from any DDS would have to be passed through a suitable PLL to clean it up and come out with a nice sine. I'm not doubting there's possible wisdom in this other approach, just having trouble understanding how it works in theory, as I understand square waves to be very rich in harmonics, and therefore would surely cause undesirable behaviour in a product detector or AM modulator...
>
> In the future I'll probably use a proper ADC and DAC as the RF input and output to the DSP, but this is pending me figuring out a good way to produce PCBs with the fine trackwork required and means of soldering such small components (the oven here only goes to 250�C). Hence why the initial phase will probably use the existing audio CODEC (which should be good for 48kHz sample rates).
>

z
Some things to think about:

If you use an Audio Codec as a digitizer, you are probably stuck with a 0 to 20 KHz bandwidth - regardless of the sampling rate. The anti-aliasing low-pass filters are usually built into the Codec.

So - If you have band-limit your IF to 10 KHz using crystal filter and you downconvert to a 10 KHz second IF, your spectrum occupies the spectrum from 5KHz to 15 KHz which is do-able. I prefer a higher speed digitizer.

The issue with the DDS (and PLL) is not a sine wave/square wave issue. The output of the DDS has discrete spurs in it. You can (and should) use a properly designed PLL to remove these DDS spurs.

Once you have a clean LO signal you need to start thinking about your mixer. Some of the highest performing H-mode mixers need a square wave LO input - and use logic gates to get it. Even if you have a very pure sine wave and feed it into a high IP3 diode mixer, the mixer's LO input impedance (caused by the switching diodes) is so non-linear, that you create harmonics in the mixer. In the end, the only perfect mixer is a multiplier - and that's in your DSP.

As you said, you can use controlled aliasing for down-conversion. This technique is called "bandpass sampling". You have to be careful that the various aliased frequencies do not overlap or the original signal cannot be reconstructed.

I like the Beagle board for this type of thing. A 48 KHz sample rate from the CODEC will do just fine.

Regarding sideband modulation and demodulation etc - this is where it gets fun.   It just software. You can try using a sideband filter. The suppressed carrier is at 10 KHz, the lower sideband is below 10 KHz, the upper sideband is above 10 KHz. (Of course you can invert the spectrum depending on how you down-convert.) Different sideband filters bandwidths are just different filter designs. You can try using a Hilbert transformer and sideband cancellation. It probably requires fewer compute cycles.

John-

This sounds like a bistable multivibrator using relay logic. Perhaps someone into digital design could figure out how to do it. It probably requires two relays.

I found this at eng-tips.com:

"Ordinary relays can be made into a bistable or "latch" by cross-coupling a spare pair of contacts on the relay to keep the coil energised once the "trigger" (e.g. from a push-switch) ceases. To make things "toggle" alternately you need at least two relays in a cross coupled configuration to break the hold-in contact of the first relay at the next push of the switch."

Hi Fred, They have made it simpler these days. You can get a push on-push off pushbutton switch, and use just one relay to achieve bistable operation. Asumming the contacts are open, the first time you push the switch, the contacts close, and stay closed until you push again, at which time they will open. This is done with mechanical do-hickeys in the switch.

Gary N4AST

Hey OM::

My g/f has a few of those do hickeys on her neck does that mean she
always stays on?

Hi OM, That is just plain ol hickeys. Whether she is on all the time
depends on how she got them. A do-hickey is something you know is
there, and you know what it does, but you don't know how it does it.

Example: A CBer might say "I can get the SWRs down on my antenna by
spraying a can of SWR remover on it, but it does better if I put this
do-hickey (tuner) between my kicker and the antenna.

Gary N4AST

```

URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

a delayed response to String Theory expert - theoretical physicist
Michio Kaku

Do the strings of String Theory act like standing waves or waves that
transmit energy?

Hi folks,

Thank you for all your replies. Some very interesting ideas there.
Certainly food for thought.

Regards,

JOHN

Its the shape of space-time which determins gravity, force, energy, and mass? There's no other relationship just structures? Experiment holds this truth!

Stuart,

Maybe I'm a little late. I found some interesting information on the
High Performance Software Defined Radio (HPSDR) project website (see
http://openhpsdr.org). All is done under open source design policy, so
you will find detailed information about their SDR hard- and software.

20 meters this time (I have about 500 more.).
All have tested good movements.
Shipping will be calculated based on 14 lbs.
PayPal and USPS money orders are like cash.
Personal checks, I wait to see if they are honored.

I also have about 500 more which today at this time I will sell them ALL at the rate of $4 each.
The list of them is at
http://www.muchstuff.com/meters/metersfs.htm
My estimate is that i can get them down to about 20 file size boxes, and about 350 lbs.

I am not offering these meters individually at this time.
They are in a storage a few mile from here.

500 are round and square and large and small, and the list at
http://www.muchstuff.com/meters/mtrsfs.htm is better than 98% accurate, but these 20 are part of that list.
These 20 below were in one carton I picked at random.)

Eugene Rippen, WB6SZS
Auburn, CA
soundval@muchstuff.com

(Since some of these require 1/8 inch over 2 inch diameter holes,
I don't measure each one, I just say 2 1/8 inches.)

WESTON 506 meter 25 DCma & 100 & 200 scales also.
WESTON 506 meter. Scale is 25, 100 & 200 DCma.
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0576.jpg

GE 8AW41 meter Scale is 15 V. AC-DC
Type AW-41. Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0579.jpg

GE 8DW552ACE8 meter 2 A. RF
Type DW-52. Thermocouple. Scale is 2 A. RF. Works.
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0580.jpg

Roller-Smith meter 50 DC microA. & DB scale.
Model DOHRG. 5000 ohms. Also has a DB scale: -4 to 0 to 3 dB. Sealed.

Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m058.jpg

Westinghouse meter. Scale is 300 DCma.
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0581.jpg

Roller-Smith meter. Scale is 300 DCV.
Type: DDHR
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0582.jpg

GE 8DW41 meter scale is 200 DCma
Type DW-41.
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0577.jpg

Simpson meter. Scale is 50 VDC
Note that the bezel is shaved on the right side.
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0578.jpg

Westinghouse meter. Scale is 300 DCma.
Style: 1209738. USN Type CAY-22238A
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0575.jpg

Burlington 321 meter. 50 DCma
Sealed.
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0570.jpg

Triplett 221 meter. Scale is 25 DCma
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0565.jpg

Triplett 221-T meter. Scale is 5 DCma
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0572.jpg

WESTON 507 meter. Scale is 10 RF Amps.
Scale says: "Antenna Current Indicator".
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0571.jpg

GE ABA8 meter. Scale is 200 DCma.
Type DW-41
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0574.jpg

Million meter. Tube checker scale "GOOD - BAD"
Radio Television Laboratories. This was for the tube testers that they made

named "Million"
There is a crack at mounting hole, is picture.
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0563.jpg

Westinghouse meter. Full scale is 0.25 Amps. "Antenna Current"
Type NT-33. Scale is marked 0 to 5 (no units epressed). Style 11640038.
"Antenna Current" on scale. Scale says: "F.S.= 0.25 Amps"
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0562.jpg

Triplett 221 meter. Scale is 150 DCma.
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0566.jpg

Triplett 221 2 DC Amps
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0568.jpg

WESTON 506 Meter. 500 DC ma
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0564.jpg

Phaostron Z-1183 meter. "Ruggedized - Sealed"
Scale says 0 to 9 "Nautical Miles"
Works. Panel hole should be 2 1/8 inches Diameter.
http://www.muchstuff.com/meters561-585/m0561.jpg

Would anyone happen to know what frequency synthesizer and PLL IC the Grundig Ocean boy 400 uses?

I want to change the tuning step on SW to 1 kHz as the 5kHz step is a bit coarse.

I was one of several who put some thought into this application.
The leading suggestion in my view, was the push to make, push to break
button, often seen for house lamp standards. These cost less than
relays. So one button, one relay, and you are set.
But you are tethered to a particular button design profile. if you were
looking for a uniform button profile to match others - this is not the
answer.

Brian W

```

Recently I've build several FM broadcast band superheterodyne receivers using e.g. NE602, SO42, A223D, uA3089PC ICs, ceramic filters and few coils. Now I am looking for similar project for AM broadcasting band. By "AM band" I mean both: Long Waves and Medium Waves.
I prefer projects with stages on separate ICs/transistors (in opposition to "all in one chip" solution). First ferrite rod antenna, then mixer/oscillator stage (on IC or few transistors), ceramic filter, IF amplifier (on IC), AM demodulator and AF stage.

I am looking for complete, tested solutions only (description, schematics, PCB). Do You know something worth of recommendation?

I know that you said that you prefer discrete component designs for your radio project, but I'd like to suggest that you at least take a look at the National LM3820N AM radio chip. BG Micro has them available for $3.00 for a tube of 25 (http://www.bgmicro.com/SPC1001.aspx). The chip is obsolete, but still presents an interesting project. The original National Semi data sheet is available at http://docs.bgmicro.com/pdf/lm3820.pdf. The datasheet gives design and layout (PCB) for several versions of a BCB AM radio. You can be as simple or complex as you wish.

Another web site that you can look at is at http://www.electronics-tutorials.com/receivers/am-radio-receivers.htm. It gives quite a bit of background and theory, including a source for a kit of parts for a receiver project.

BTW, you can get the hard-to-fing RF, IF and Osc inductors from Dan's Small Parts at http://www.danssmallpartsandkits.net/. The web site doesn't have a search function, so you'll have to manually scan thru the listings to find them. Good prices too.

Happy constructing,

Thanks for suggestion. I will search for this chip, but I am not quite sure if it's widely available in my country (Poland).
Usually I still use polish ICs from CEMI semiconductor factory (unfortunately they're not existing any more) + some Russian and western parts, depending of their avalaibility. :) Most of those polish and russian, that I have in my supplies are equivalents of western integrated circuits.

There are many older AM chips that were also available as Russian parts
as well (copied?), like the TCA440 for example.

======================================
You might find suitable components at Conrad Electronics (web site) ,a
German company ,shipping components all over Europe .
With Poland now being an EU country no import duty is required ,just
German VAT.

As I said in my post, these chips are obsolete, so I'm sure they aren't widely available. BG Micro sells them for $3.00 US per tube of 25, plus $15.00 US (minimum) for shipping to countries other than Canada. If you're interested in trying them, I have a most of a tube of them in my parts bin. I used a few of them for 40 & 80 meter receivers a few years ago, and still have about 20 of them left. If you wish, I'd be glad to mail you a few to experiment with.

Ordering from BG Micro might be a bit expensive for you, but I'd be glad to send you a few, gratis. If interested, contact me directly at the address below.

Thank you for your offer. I will remember it, but first I would like to try find it in local electronic stores.
And I still prefer a little bit more complicated and challenging constructions, with each stage on separate transistor or IC. I found only few polish publications from early 70's amateur radio press. All of them consist germanium transistors, manually made coils and few transformers in AF stage. :)

There recevers for 40 and 80 meter band, which You mentioned... What was that? Superheterodyne? Homodyne?

They were superhet receivers, since the LM3820 is basically a superhet design. The chip has poor sensitivity, so I had to add an RF preamp stage to get the performance up. I thought about trying to run it as a TRF receiver, but ran into trouble biasing the oscillator stage so that the mixer would work. It was more trouble than it was worth.

The final build was decent, but not great. Sensitivity was around 3uv, even with a good FET preamp stage. I used them for about 18 months before abandoning them for a better receiver (an old Heathkit unit), which I still have and use occasionally.

You should be able to make a pretty good BCB receiver with these chips, since the in-band noise will swamp the receiver if you try to make it more sensitive. You can find good preamp designs for BCB on the web if you wish to experiment. You might be able to get a bit more sensitivity by making the RF tanks more selective (higher Q inductors and capacitors, high impedance FET preamp stage, etc).

If only it was that easy! The stepping rate is dictated by the reference frequency and N divider. The latter is dictated by the internal structure of the processor.

Several years ago while making inductors for tuning a class E amplifier we
end up with a 4-1/2 turn inductor. The inductor used a 3F3 potcore, gapped I
think,
but it has been awhile. The inductor was driven hard but below saturation.
The problem; the 1/2 turn got HOT. Four turns or five turns were ok.
My physicist friend had an EE verify the problem 2000 miles away.

So, can anyone tell me why 1/2 turn would make such a difference in the
heating?

Thanks, MikeK

I'm about to embark on a "vintage" valve (tube) receiver but have a
question (probably more questions later!!!) about the IF transformers.
Years ago I was able to purchase the transformers for 455 KHz but the
ones I want are for 9 MHz. I think I'll have to wind them. I don't have
any 10.7 MHz transformers. Any advice appreciated. I'm really interested
in the turns ratios as I'll be winding the primaries for a Q of about
100.
Do the inter-IF amp windings have the same turns ratio as the balanced
modulator detector transformer? I think not. Do I have to worry about
turns ratio for anode impedance to grid impedance and what are "rule of
thumb" ratios? Can I use FTxx toroids as opposed to say quarter inch
coil formers with screening cans? So many questions. It's great being a
radio amateur!

Thanks. Howard.

```

URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Hey OM:

When I made a living selling tubes, my fav best method of stopping VHF
parasitic oscillations was when the transconductance went kaput from
the little grid wire overheating and burning out. I made a living off
of parasitics.

sum gr8 articles on your website too OM.

73,
de n8zu.

I'm not that surprised, I've had similar responses to shareware type donations.

Never the less, you've chipped in, perhaps others who are pro-digital but anti DSTAR will follow your example.

There is no way that is going to happen. The Codec2 will not be compatible
with AMBE, so a commercially manufactured transceiver will not be able
to talk to an open one. D-Star does not have the capability to negotiate a
CODEC in the protocol, so beside the low level of the coded the higher
levels will also need to be redone.
There is no way the "proprietary technology can be replaced", the only
thing that could happen is that a second network, incompatible with

the current D-STAR network, could be setup using open technology.
Frankly, I don't think we still have the userbase to make that happen.

I am probably not the only one with this opinion, and I am not amazed
that there are not many that would sponsor a development like this that
cannot be put to real use.

The only useful development would be the development of a free, open
codec that is compatible with AMBE. But that would have to be done in
an environment that does not bow to US Patents etc, or it will have to
wait until all the patents have expired.

"ICOM's D*STAR transceivers, even the handie-talkies, have their AMBE codec on a removable daughter card. This is wonderful, because it gives us a path to change the codec. "

I think hams should be looking into using TETRA instead of DSTAR/P25, if we
are to actually consider using digital voice technology.  I believe there
would be far fewer encumbrances than with P25, and there are LOTS more surplus
radios around.

Fellow amateur radio operators: Over the past 14-yrs I have been jackbooted numerous times off of amateur radio discussion groups because I critiqued somewhat less than technically correct statements by a male friend of the moderator/censor. The first moderated discussion group I ever joined was AMPS - back in 1996. Within 3-hours I received a telephone call from the moderator warning me that I would not be allowed to critique statements from W8JI. When I asked if this rule applied to sttements that were technically specious, I was told to go easy. Within a few weeks I had been jackbooted off of AMPS.   Thanks to complaints from technically enlighted members of AMPS, I eventually got reinstated but I was eventually jackbooted again for the same reason when we got a new moderator/censor. This happened several times.

I can not understand why any sane amateur radio operator would want to participate in a discussion group where specious statements from boyfriends of the censor/modertor are shielded.

end

Really?

Most people have absolutely no problem with moderated groups, which they
find pleasantly free of crap.

�  Bert H. are uou comfortable with the statement: that dipmeters are
useless because they simultaneously couple to everything within several
feet?  or how anout: resistance wire has reverse RF skin-effect at HF?

Glad to see you here Rich. I have learned a lot from you in your articles & your great help on the phone with my 3-500 amps that I couldn't stop a parasitic in. Your kit you sent me along with a lot of literature cured that amp & the suppressors don't burn up . Amps runs full out on 160 thru 10 mtrs. Again thanks for your help.

Question here for Richard and his wealth of experience, with all welcome to comment of course;

Does the capacitor bypass techniques described in:

http://www.bunkerofdoom.com/lit/zener/index.html

,have a useful improvement in rf amplifier imd, or have any merit in your opinion?

I took your advice on 10 ohm cathode resistors (unbypassed) in a cathode driven sweep tube amp here, and 40m imd performance was substantially improved.

Thanks for the sb220 improvements also, very beneficial on a HL2200 I had in the past.

73

Adrian

� I've never done an A/B test to see if a substantial bypass C helps
Adrian but since a g-g 3-500Z is quite linear as long as its ZSAC is 75mA
to 100mA, there can be a fairly wide variation in bias potential before
distortion enters the picture.

I am using Linux.  But I guess that does not count as a UNIX based OS.

Check what is in your fullname config setting.  There is a character
with hex value 95 there.  But you don't have the matching character set
header that is supposed to tell what that character should mean.

(without a character set header, the default character set is 7-bit ASCII
which does not include <95>)

Maybe using the wrong news provider. Not all news providers have their
servers configured to handle moderated newsgroups properly.

Otherwise, have you asked the moderator?

My news reader (Demon's 'Turnpike') has the 'moderated' box checked in
the configuration for rec.radio.amateur.moderated (which is the default
when you add a new NG which is moderated). I don't think that there have
been problems with other moderated NGs although, these days, I only post
occasionally in uk.legal.moderated.

>Otherwise, have you asked the moderator?

The link below seems like something hams should have done long ago. I assume there is some reason not to but thought I would float it here.

The front end is easy and has been done many times for Class D and Class E transmitters.

The unique part is the stacking of low voltage modulators to achieve high voltage for tubes.

Seems like scaling this down to our power levels would be pretty straight forward but I don't happen to know how to do it.

Wa1QIX has a PDM Modulator board/kit that I have on order which solves most of the front end details but the series modulator boards are beyond my pay grade.

Anyone on this list have any interest or ideas on the subject?

His postings do not specify the character set he is using.
Probably it is Windows-1252.  A more standard character set leaves the
character <95> undefined.

Most likely, if that code was supposed to represent a bullet.

>A more standard character set leaves the
>character <95> undefined.

Codes 80..9F hex and U+0080 .. U+009F belong to the C1 control area in
many standards (ISO 8859 and Unicode) and 95h represents "Message
Waiting" control code.

While I have used C1 controls to control terminals, I do not recall
that I would have used MW :-).

Then it IS the font, even though you don't know what I see!

I've had problems with "high ASCII" characters over the years. One that caused problems was Microsoft's use of such a character for the 1/2 fraction, which appears as an Omega symbol (�) on my screen. Until I realized what was happening, some Word documents didn't make sense. Fortunately, newer versions of Word for Mac fixed the problem.

I think the point others were trying to make, is that your use of the <95> (�) character looks bad when viewed by many people. It isn't a Unix character, it is a Macintosh font character that was in use before OS X came on the scene.

Fred

It doesn't matter anyway.
The OS has nothing to do with this.
Your news program is broken, or does not expect the use you make of it.

As your news program does not tell what character set you use, you should
limit your characters to the 00-7F range.

>>Check what is in your fullname config setting.
>
> ** I am not using an OS with such a setting in the system prefs.

Probably it is in your news program.
Somewhere you have set that your name, "<95> R. L. Measures.", has to
appear above your news postings.
When you change that to "R. L. Measures" all trouble is gone.

And don't insert that character in replies either.

```

I have received advice which leads me to suspect that my news machine
may, in the case of rec.radio.amateur.moderated, be sending my posts to
the wrong email address. If so, this would explain the problem.

You apparently don't understand that what you see on your screen is
not what others see on their screen!

What do you see when you hit Shift-option k?
Don't just hit the keys, but explain what you see on the screen.

Also, check if you can set the news program to use a standard character
set, like ISO-8859-1 or Unicode UTF-8.

The problems is not in the interface between your program and the
operating system, but in the interface between the program and usenet.

The program does not operate according to the conventions of usenet.

When it is not using the US-ASCII character set (00-7F), it should tell
the reader what character set it uses. This program doesn't, or you
have not configured it to do so.

>>As your news program does not tell what character set you use, you should

The setting is either in the program or in the operating system.
The software does not invent the setting "<95> R. L. Measures." by itself,
not even on an Apple. This information has been entered by you sometime.

```
> **  About a third of the denizens in the Newsgroups I frequent have no
> trouble seeing the bullet character (option 8) and the bitten apple
> character (shift-option k).

Probably your friends all use the same software as you do.
It is not surprising that the same error it has when posting an article
is also present when reading it back.

You probably see that only on a Mac.
Windows users most likely see a bullet.
Users of other systems see an unrecongnized character, shown on my
system as the hex value in angle brackets.

> I don't see fullname anything in Newswatcher 2.2 3b2 Peferences.

Richard-

There is a newer Newswatcher. I think the latest is version 3.5.3b3.

Rather than using a non-standard bitten apple as part of your name, why not include an X-Face image in the headers? Under Special - Personalities - Headers & Misc. - Signature & Headers - Extra News Headers, paste the following into the box:

```
X-Face: nrf3>{WQ6c&r+7@e)"]0G60`-6ND^)I2mI%>)QGYa=9"=7jhd-g2|b3!>Al0+
        Ccb%xGQshhi|g@QU2$
```

That image is the bitten apple. It will show up in the heading of your messages for those people who have a news reader with X-Face capability.

You can paste that into a text file and name it with the suffix, .x-face. (filename.x-face) If you drop that file onto GraphicConverter, it should open to show a large crude bitten apple. When viewed small, it looks much better. GraphicConverter is capable of creating additional x-face images.

Seems like mainly you need a way to feed the audio into each of the
amplifiers, and power supplies for each amplifier such that the amp
can "float" up and down at a high enough rate. That is, any

capacitance to ground must be driven by the amplifiers below. The audio input must have good common mode rejection. That's not necessarily terribly difficult, just a requirement. It could be done with transformers, but an interesting variation might be to have an output from each amplifier to drive the amplifier above it in the chain. One other thing: if you are wanting to do it as suggested on the CE page you linked to, you need amplifiers that output nominally 0 to +V, not +/-V, and are happy to deliver highest current at the +V peaks. I assume to start with that you don't need to do the controlled-carrier thing. I suppose to do that you'd want input coupling all the way down to DC.

Cheers,
Tom

It isn't in the preferences.  "Special" is an item in the menu bar.
```

I also used NewsWatcher for a long time but eventually updated to MTNW.
So far there are no problems I've noticed. I can't speak for the latest
version used with an older OS.

Yes. It is a graphics app that has been around for a long time,
probably as long as NewsWatcher.

Dip meters do couple to conductors in the near field.
Current density of resistive wire does increease with depth. Call that
reverse skin effect if you like?

Hmmm...you have been jackbooted off several moderated groups, you say?

Why ever would that happen?    :-)

It seems that NewsWatcher-X (2.2.3b2) has a place in preferences called
"Extra Header Lines". I tried pasting my x-face there, and will soon see
if it will successfully post the image to this message!

It appears that 2.2.3b2 does not display x-face images like the newer
version does.

By the way, the MTNW has an asterisk by each thread where you have posted
a message. Even when collapsed, you can tell which threads to check for
replies. With your way, you can only recognize your posting when it is
the first one.

Indeed... D-Star radios will always talk AMBE... and thier legality on
amateur bands will always be questionable.

Nothing stops however, someone coming up with an open system ... but then say, modifying the D-Star gateway software to make *that* interoperable with the aforementioned open system.

So yes, D-Star radios will be able to talk to some other digital radio standard, but only through a repeater or translator of some description.

> I am probably not the only one with this opinion, and I am not amazed

I think there are lots of possible options for a low-bandwidth and royalty-free CODEC. VoIP on slow links... digital voice on HF... just to name two.

> The only useful development would be the development of a free, open
> codec that is compatible with AMBE. =A0But that would have to be done in

I'm not sure that "following the leader" is the way to go here. Yes, if I wanted a Mickey Mouse-like character to use in a cartoon, I *could* wait for Buena Vista's copyright on him to expire (lawyers already managed to negotiate a 70-year expiry on the copyright). I dare say AMBE will be locked down for at least several years yet.

The question is, do we want to sit around, or do we want to actively seek our own. I personally have little money to contribute (don't have PayPal... so that option is not open to me) but I will probably have a look at it and see if there are other ways to help the cause. However, like the original author of CODEC2, I have limited time too.

Summary: Recruitment announcement for ham-radio-related FAQ articles
Keywords: FAQ, Intro, amateur, ham, radio, recruit, recruitment
Xref: g2news2.google.com rec.radio.amateur.antenna:19173 rec.radio.amateur.dx:704
```

rec.radio.amateur.equipment:2321 rec.radio.amateur.homebrew:3873
rec.radio.amateur.misc:5316 rec.radio.amateur.policy:30420 rec.radio.info:1637

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Are all the fundamental forces nothing but simple PHASE relationships?

"in phase attract"

Type those three words - above - into Google (Include quote marks) to learn not only the basics of electricity but how all the fundamental forces work.

Or click the following link that will give you the same page in Google. http://www.google.com/search?hl=en&source=hp&q=%22in+phase+attract%22&btnG=Google+Search

Not only do all electric motors obey these phase laws but this entire universe does as well.

(Click link below.)

Greetings everyone!

I have been living in UK the last 8 years, since having to leave my home country Zimbabwe (the Z21GQ c/s). My primary job most of my life was the design and construction of power electronics - things like 25kA rectifiers and railway traction systems, though I started out as an RF engineer with the Rhodesian PTC in 1963 and served in the Signals Workshop during the Rhodesian war (part-time). Now I teach people all over thr world how to maintain and repair linear accelerators from 2 to 15MeV.

I am very interested in homebrew (back home I had a factory making DIY solar lighting kits and getting pcb's done was no problem) but here in the UK I am lost for RF components, pcb makers and so on.

What I am particulary interested right now is whether anyone has a good circuit for an AD9910 DDS that I can control from my laptop? Of course, where to get a pcb would be a wonderful advantage. I've designed

hundreds of boards in the past, but not since comning to the UK.
Initially I want to use the DDS to check out HF front end filer
characteristics for 14, 18, 10MHz

I have 2 Telefunkeb E1500 RX's as well as an ICOM IC-745. Longer term I
would like to install H-Mode mixers in both, and narrow band filters in
the E1500 (ham bands)

Any emails and ideas would be greatly appreciated

Charles
M0DED

Simple?
Probably not. Else the legions of physicists who long to explain and unify the fundamental forces, would have succeeded after 80 years or so of concentrated effort.

Charles,

I emailed a reply to you, but it bounced. So here is what I said:

I can't answer your questions, but I think it would be a good idea for you to join the RSGB Technical reflector and ask there:

http://groups.yahoo.com/group/rsgbtech/

You don't have to be an RSGB member to join the reflector, and I know
that the people there are very helpful.

Good luck.

In a direct conversion receiver, does the osc. run at
exactly the same frequency as the received signal?

Assuming the answer is yes;
Is it possible to have a high Q LC front end at the output from the
antenna,
split the signal and feed one output to the rf input of the mixer and feed
the other splitter output to an amplifier and use the amplified signal to
drive the osc input of the mixer?

Simple block diagram of proposed idea;

I don't think so. You would be using the exact same frequencies as both
the RF and LO signals, resulting in an I.F. of (difference) zero
(DC--You can't hear DC.)
) or (sum) 2XRF (Can't hear that either).

NO, for the same reason you can't fake the BFO at the final detector the
same way. You need to (re)inject a carrier to receive a CW or SSB

signal, and the receiver must supply this carrier. A direct conversion receiver is just a tunable IF, detector, and BFO without a superhet front end. There ARE synchronous AM detectors that do what you propose, but this works because the incoming carrier is already there.

Probably not.
You would like to boost the input with a broadband amp, then select the
signal of interest with a local oscillator.

Using the signal itself to select the same signal from dozens of others
would need processing a carrier to provide an LO.
Interesting!

the idea is not new (a few decades ago it was called "carrier regeneration", and has been extensively used in synchronous demodulation of AM and DSB, VSB and SSB with partially suppressed carrier), but you need at least a residual carrier.

In the case of SSB, although carrier suppression is far from perfect, filtering and amplifying the residual carrier up to an usable level is not impossible, but definitely far from easy... :)

Speaking about CW, recovering the carrier is very easy (a simple PLL with a very slow time constant would do the trick), but the next step should be displacing said recovered carrier of a useful amount (say, 600-800 Hz) to give a beat note, and this is not so easily done.

Regards,

Well, what you'd be getting here (I think) is a high-tech version of a crystal radio.

Remember that a mixer (diode-ring or Gilbert cell or etc.) is essentially a multiplier... it multiplies the "RF" signal with the "LO" signal, thus creating additional signals at the sum and difference frequencies. In a simple DC receiver for sideband, you tune the LO to the nominal carrier frequency of the incoming signal, and the "difference" frequencies which come out of the mixer are thus the audio sidebands, shifted down to baseband.

If you multiply the signal by itself (i.e. splitting it and putting it into two ports of a mixer) you'll create base-band "difference" components which match the original sidebands (if there's some carrier present in the signal) plus *all* of the sum-and-differences of the original audio components. In short, you'll get the audio, plus a lot of harmonic and intermodulation distortion.

That's just what you get when you feed AM into a simple diode detector, with no LO (i.e. a crystal radio). The square-law response of the diode has the effect of multiplying every RF component in the incoming signal with every other, thus recreating the original audio plus lots of HD and IMD.

If the incoming signal is fully-suppressed-carrier SSB, you won't have any carrier present to act as a frequency reference or to result in the recovery of the original signal content via multiplication. All you'll have is every sideband in the signal, multiplied by every other sideband... an amazing mishmash of intermodulation, without the original baseband signal.

If you're just interested in AM signals, then you could filter the incoming signal, split it, amplify one half, and run this through a *very* narrow-band filter (think "oscillator and PLL") and use this as the LO input to the mixer. In effect, what you'd be doing is creating an LO signal which is a copy of the original signal's carrier, with the sidebands stripped away by the ultra-narrow filter / PLL. This is a pretty basic way of doing AM reception.

This won't work with SSB, though, as there's no carrier to lock onto.

My word!!! This exchange evidently occurred 6 months ago! I do recall overlooking the pertinent definition of chuffed on Dictionary.com. Oh the mysteries of the internet.

On the other hand, seems like stuff like this started happening once before and things eventually degraded to the point where I finally had to reinstall windoze to get everything settled down again...

Later,
Charlie C.

This is how some early video-IF chips performed the video detection (instead of simple envelope detection). There was a high-Q resonance circuit tuned to the nominal video-IF, which was excited by the visual carrier. Due to the high Q, the resonator was "ringing" for a few cycles, even if there was no carrier present for a few cycles.

This filtered carrier was then used by the product detector (multiplier) to extract the video and intercarrier sound.

In countries using negative video modulation (sync 100 %, black 80-90 % and white about 10 %), the intercarrier sound system could be used. After the video detector, the sound FM signal was at 4.5, 5.5, 6.0 or 6.5 MHz depending on system and was then processed with an ordinary FM strip tuned to that frequency.

For proper operation, this required that both the visual as well as audio carrier frequency was always present in order to produce the frequency difference signal for the 4.5-6.5 MHz audio subcarrier.

For various reasons (bad filter group delay, overmodulated white levels, especially subtitles), the video level dropped to 0 %, the simple envelope detector did not work and hence the intercarrier audio signal could not be formed and there was various forms "picture in audio" buzz.

The ringing in high-Q section at the product detector made it possible to "ride through" the short video signal interruption, intercarrier audio-IF was produced constantly and thus the buzz in the audio was reduced.

One of the definitions of insanity is doing the same thing over and
over again with the expectation of producing different results.

No, because regeneration is about feeding the output of a stage back into
the input, so there is near infinite amplification.

That was before Jurassic Park came out. Before then only "rock star
mathemticians" had heard of Chaos Theory, afterwards (almost) everyone had.

Quite so, but *not* using windoze would probably produce even more
insanity - at least temporarily anyway. :-)

  Hi all,
 I started my post writing about AMBCB and an example frequency of 1430 khz.
  Then I rewrote it and skipped all that.
So from what I have gleened from the responses, I would need to feed the
1430 khz
into the IF mixer input to get the baseband audio.
 I don't know what the advantage of this would be but the local osc would be
as
stable as the radio station. And no need to build an oscilator.
 Any other feedback now that I'm talking AM BCB radio?
                                                  Mike
```

Hello Mike,

If you Google on "Synchronous AM Detector" and "Exalted Carrier Reception"
you'll find lots of info

This is good place to start....
http://www.radio-electronics.com/info/receivers/synchdet/sync_det.php

Regards .... Zim

Reason: I'm new to all this and I want to learn whatever I can.

Good enough?

If one does not ask questions how does one learn?

You can buy a probe with a higher frequency rating than your scope has and
it will work fine, it just will be more expensive.
Regards,
Bob

Thank you very much Gary.

I just won a set of 100 MHZ probes with kit on ebay.
I'm building 15 HZ zapper circuits and I need the scope to make sure my signal is as close to 15 HZ as possible. I almost bought one of those DSO nano's but someone told me they are **** ;). They told me I was better off spending money on an analog unit rather then waste cash on the Nano.

Me being new to all this it took me a bit to learn how to read an analog scope but I'm picking it all up pretty good.

```
Thanks again and have a great day.

Jim

No. It is 3dB Bandwidth. Degrade will start earlier. You will have lost
half power or in voltage around 30% of the signal.

Therefore using a probe with a >60
> MHZ rating will allow you to realize all of your scope's capabilities.

There is also a capacitance specification that should match. It is
however unlikely that it should not. Go ahead with the 100MHz probes if
you get them at a fair price.

Here are some guidelines to determine more exactly what the interaction
between the scope and probe is:
Bandwidth is BW
Risetime is Tr
BW = 0.35/Tr
Tr(overall) = Sqrt(Tr(scope)^2 + Tr(probe)^2)

Then if
Scope Tr at 60 MHz = 5.9nS
Probe Tr at 100 MHz = 3.5 nS
Overall Tr = 6.80 nS, making overall -3db bandwidth = 51.4 MHz

Though this sounds plausible, and it's thought through,
I think the result is mistaken.
A 60MHz scope is not a 60 MHz scope only if used with
 (say) 3 GHz probes; its a 60 MHz scope if used with the probes as
provided or specified by the maker.

I know where you are coming from. If both tubes of a push pull long tail
pair have grounded grids, it would be awkward to insert the signal.
But if the push pull setup consists of cascode tubes each side, then a
regular grid could inject the signal to modulate the grounded grid tube
cathode current in cascode, to reflect on the other leg.

It's not mistaken... in fact, it's well documented. Here are some
attributions that elaborate on the effects of a probe on the overall
bandwidth of a scope/probe combination.
http://books.google.com/books?
id=xHASd9YksRgC&pg=PA77&lpg=PA77&dq=scope+OR+oscilloscope+
%22equivalent+bandwidth%22+probe&source=bl&ots=CjB4keyul8&sig=cKSDnI9nV3Iwos1KRpP_
3nNjC9s&hl=en&ei=KTwETKKiLMP48Ab57djTDQ&sa=X&oi=book_result&ct=result&resnum=3&ved

=0CCAQ6AEwAg#v=onepage&q=scope%20OR%20oscilloscope%20%22equivalent%20bandwidth%22%
20probe&f=false

http://www.adler-instrumentos.es/imagenes_web/notas_aplicacion/
Fundamentos%20de%20Integridad%20de%20Se%C3%B1al.pdf
pg 3

http://www.freelists.org/post/si-list/high-speed-test-measurement-equipment,9

http://www.analog.com/library/analogdialogue/cd/vol41n1.pdf pg 13

As you can see from the documents, the scope and probe bandwidths do interact as the RMS sum of the two. The vertical bandwidth or risetime of scopes is specified at the scope's input connector. If the bandwidth specification includes the probe, it will be specified as such. In those cases, the scope's bandwidth will be specified separately, and will be higher than the scope/probe combination.
Vertical bandwidth on many high quality scopes will be described in their manuals or spec sheets when using a variety of probes, and will reflect the equivalent bandwidth accordingly.

I agree with the equation for summing bandwidth determining components,
and I agree with many of your other comments.

But concluding that a 60 MHz scope with 100MHz probes provides a 51 MHz
bandwidth combination is (in my view) mistaken.

This is not the Tektronix way.
And the Tektronix way is the ONLY way with scopes!   :-)

[Re 60 MHz scope]
>>>>> No. It is 3dB Bandwidth. Degrade will start earlier. You will have
>>>>> lost half power or in voltage around 30% of the signal.

The idea that a 55 MHz sine wave of 5 volt P-P amplitude would only register about 3.6 volts on a 60 MHz scope is an alien idea to me. That would render such a scope all but useless....

I think it is possibly a European style definition of the scope bandwidth as a 3 Db down bandwidth that's causing this debate.

I suggest that in American usage, I would be more likely to expect a 60 MHz sine wave to be not more than 5% down as indicated on a 60 MHz scope with its maker's standard probes.

Brian W

I'm interested in seeing info on the Tektronix way that proves that I am mistaken. I provided several sources that defend my statements. Did you read the sources that I provided links for? All quite credible sources. Did you do the math, or is your conclusion just an opinion? How would you calculate the combined risetime/bandwidth of a scope/probe combination?

Please don't interpret my questions as being confrontational, I'm genuinely interested in learning if the technique that I used for years in calibration labs was, in fact, correct or totally wrong. The technique that we used was this:
Using a high bandwidth scope, measure its risetime without the probe being connected (scope connected directly to a fast-rise pulse generator).
Connect the probe being calibrated to the scope input, and connect the probe tip directly to the pulse generator output.
Measure the resulting pulse risetime.
Using the formula that I gave previously (rearranged to find the probe's risetime), calculate the probe's risetime and bandwidth.
This method of measuring the performance of a probe worked quite well for the lab and our customers for the years that I was a cal technician (commercial and military).

Have you used many older scopes? Effectively the older the scope, the more like that a scope labeled "60MHz" really did mean that the scope itself was 3dB down at that point -- and of course the probe will just make things worse. Things did get blurry over time, with HP and Tek starting to spec scopes based on a combination of the probe and mainframe used ... and perhaps not use 3dB as a reference anymore (all the bandwidth extension tricks they used tended to make the frequency response no longer look like a simple single-pole roll-off, and one could suggest that a 3dB point definition of bandwidth isn't that useful if you're already dropping at, e.g., 12dB or 18dB/octave rather than the expected 6 at that point...). And finally, once scopes started "going digital" in the late '80s and beyond, the response of the scope itself often became a lot closer to a brick-wall rather than the single-dominant-pole roll-off the old analog scopes often saw, at which point -- if you had a good enough probe -- the frequency response at the stated bandwidth might very well be <1dB down (...which is still 10% down in voltage, though!).

If you buy a new scope today, that's very likely the case... but if you get an old boat anchor, it'd be VERY surprising if it were anywhere close to "only" 5% off.

If all you have available is a pulse generator, this is a decent enough method -- just know that the formula to convert between rise time and bandwidth assumes a single-pole frequency rolloff, which is usually -- but not always -- a reasonable assumption.

A more insightful means of measuring scope bandwidth is to take an RF generator that can produce a repetitive frequency sweep (with a leveled output), have the start of it trigger the scope, and then adjust the timebase settings so that you get, e.g., 10MHz or 100MHz or some other convenient MHz sweep per division. In other words, the scope's display effectively becomes a Bode plot of the system (scope + probe combined) response.

Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Thanks for the elaboration... makes sense. And yes, after wideband leveled generstors became available, we did use them to measure frequency response on scopes, but still relied on the risetime method to characterize probes. The reason for that was that the leveled generators that we had didn't cover the full spectrum of the scopes and probes that we encountered; we had a 30 picosecond risetime pulser that handled everything we saw.

It has been several years since I worked in a cal lab, so the technology has progressed a good deal since. Are there any texts that describe the technique(s) by which the response of any given scope/probe combination can be calculated and verified?   Not that I need to do it any more, just interested in knowing.

I started looking for a reference that I could trust - and I found it in
a Tektronix note - a note that totally supports your position.

Ooops! I was wrong - with a misplaced sense of what one can measure with
Tektronix scopes. Sorry.... I appreciate your level tone though!

The question was would a 100 MHZ probe work with a 60 MHZ scope.  The
asker claimed to be a beginner.  I made a general comment about why it
would.  I saw no reason to muddy the waters by talking about half
power points and 3dB bandwidths.  Trying to make it simple.

Hey OM:
Great link there to the Tech article from tek tronics

As  pointed out in that article, a scope is worthless for measuring
voltages. Towit a 60Mhz scope is only good to 10 Mhz, going by their
standards, published, in that article.

I suppose this is more repair than homebrew, but since at least it's in the right spirit I hope you'll indulge me...

Took a lightning hit on the power line about a week ago. The ham antennas were disconnected so the ham gear survived, but some of my computer & consumer gear wasn't so lucky.

In particular, a Sony XDR-F1HD HD Radio tuner.

It actually works fine. However, there's about 600mV of AC between ground and the shield sides of the audio output and antenna input jacks. As you might guess, this leads to a bit of a hum problem!

Suspected leakage across the power transformer (between primary & secondary) but I'm not finding any with an ohmmeter. There's absolutely *nothing* on the primary side of the transformer except the power cord -- no capacitors to ground, nothing like that. Silk-screen on the power supply board does say there's a fuse *inside* the transformer but obviously that's not going to be a source of a ground fault.

I'm confident the fault is in the Sony (and not the audio amplifier or a damaged antenna cable) since if I connect the same audio cables and antenna to the old analog tuner it works fine.

Anyone have any good ideas where to look?

I guess I could:

- Come up with an isolation transformer & just run it that way. (it only draws 13 watts)
- Build up an external power supply. It only needs +5.2 and +10.5V unregulated, and the connection points are silk-screened on the board.
- Live with it & just kick in the high-pass filter. (and use the analog tuner if I want to listen to a program -- the Sony is for DXing..)

Hey OM:

I know you got a screw loose there for sure.
Back in the day I used to make a living repairing Sony product's
All the Techs' in the shop would kill to get their hands on an easy
fix Sony
I fixed many a Sony audio product just by tightening all the chassis's
screws

There was a service flash for that trouble so it was real.

I would suggest temporally swapping out the xformer with something
comparable or remove the xformer from the radio and see if it has leakage
outside the radio.  (assuming it's not a switching supply)

First thing I would do is check my cables, sounds like you have an
open ground or a ground loop among other possible problems listed. Why
do this first? Its EZ.

Between you, me, y'all and the fencepost I'd look for basic PS problems and not focus on the "600mV of AC between ground and the shield sides of the audio output and antenna input jacks".

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived

```
at http://www.faqs.org/faqs/radio/personal-intro/ ):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article       |
is that it does not mention newer amateur radio newsgroups created since      |
it was written, including:                                                    |

 rec.radio.amateur.antenna                                                    |
 rec.radio.amateur.boatanchors                                                |
 rec.radio.amateur.dx                                                         |
 rec.radio.amateur.equipment                                                  |
 rec.radio.amateur.homebrew                                                   |
 rec.radio.amateur.moderated                                                  |
 rec.radio.amateur.space                                                      |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions.  We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

The question is " should these two points be at ground or not. If they
are I would have to best guess that something got popped in the
antenna input.

<sinp>

Many PC Board designs incorporate 'thin' foil paths that are intentionally used as fuses... linking an input ground foil group to a power supply foil group is one such usage. The hit may have blown a trace that isn't immediately visible.

I suffered the effects of a near by strike last year. The induced field blew out a myriad of low-level input circuits on everything from wireless phones, to the 1000BT inputs on my server, and 24 port switch, monitors... not the P.S., remote ant tuners, on and on... Didn't loose a single power supply or fuse. As a testament to ICOM engineering my IC-7800, at the time connected to two antennas, suffered no damage. My Elecraft K2, connect to a coax run that terminated at an outdoor antenna switch but was not selected, came through OK too.

It doesn't matter in which continent you use an oscilloscope it will have
the same specification.  But I do agree that Tektronix are pretty good
scopes.

Lightning came do some pretty strange things to electronic equipment. I once repaired a Radio Shack color computer that had 4 or 5 lines of it data bus vaporized without damaging anything else. After the damaged area was repaired with jumpers the computer worked fine. To me the fact that the innards of this computer survived is as impressive as the service panel that gets blown out of the wall and across the room or the tree that is completely stripped of bark. The damage was done directly beneath the uP chip.

The Noon Time Forum is a meeting place for hams with an eclectic interest in everything from Amateur Radio to Zoology.

We meet every week day at 12 Noon Chicago time on 3870 AM. Stations run
everything from QRP rice boxes to QRO plate modulated old buzzard rigs.

Net control M-T is Jack, K9ACT and one of several alternates on Friday.

For those out of range or busy at work, we are now streaming live audio
to share our fun with the world. There is also a chat window to share
your comments with the group on the air.

You can access the stream at http://schmidling.com/ntf.htm

Or, click on the link at QRZ.com... K9ACT

73, Jack K9ACT

I'd like to make a plug (pun) for a rather new 'home' vendor. Good guys deserve a 'plug' :)

Western Sierra Radio.

He's making 4-5-6 pin coil forms at good prices and excellent quality.
I was a bit suspicious about the black XXX grade phenolic but I did some testing and its good stuff. Even after soaking up some of my tropical moisture I only see about 30 Megs DCR between pins. That's more than adequate for the intended use and better than the XX grade which I have been using for my own homebrew forms.

Since Jim Fred passed away these have been scarce out in the marketplace.

They are well-machined, the pins are good and tight and the gluing is solid. I'd say they are a notch up in overall quality from Jim's forms.

Anyway, if you need plug-in coil forms here's the website:

http://www.westernsierraradio.com

(no affiliation, just a satisfied customer)

-Bill

Basic repeater controllers are cheap these days.
I'm using a CAT-1000 on my 2 meter machine.
The biggest problem you will need to overcome
is receiver desens when the transmitter is keyed.

Unfortunately that takes a lot of horizontal real
estate to obtain satisfactory isolation between the RX and TX
antennas. The best way is to use a good quality duplexer on a
single antenna, but now your talking about a major expense.

Pete

� RON -- I would install a pulley on a short arm at the top of the tower so that I could rig a halyard to raise and lower the middle of an inverted-V antenna wire.   One end of the wire is the feed point (fed against gnd) and the unfed end has an insulator and a tie off to a point at least 7' above ground.   The feed point Z can be up to several kilo-ohms, so an L-network is used to match the feed Z to 50-ohms. A remote controlled L-network is a good way to go.   When this antenna is a half-wave, it's called a Hertz antenna and it acts like a plain-vanilla halfwave inverted V dipole -- but with the advantage that it can be tuned to work on any frequency for which the wire length is at least 0.2 wavelengths.
  - notes - Hertz antennas have an advantage in the Winter since the feedline is not up in the air. /// The most durable antenna wire is braided phosphor bronze, #22 will easily carry 1500W. /// when viewed from above the wire must be pretty much is a straight line and not fold back on itself.

Even though it does not appear on the schematic diagram, every tube-type HF amplifier has a resonant circuit in its anode circuitry that resonates somewhere in the VHF region. This called a parasitic resonance. Whenever the DC anode current changes, the parasitic circuit rings - much like a struck bell and generates a smallish damped wave signal at the VHF resonance point. - note - this is the same principle that enabled spark transmtters to produce RF from a DC source.

Since all tubes have feedback C between the output (anode) and the input (cathode for cathode-driven and grid for grid driven), the damped-wave VHF signal is amplified - whereupon some of the amplified signal can be fedback again and re-amplified -- resulting in oscillation. Because tube gain is pettty much tube-transconductance x the resistive load (RL) on the anode, one way to reduce the chance of VHF oscillation is to artifically reduce the VHF gain of the tube by lowering the VHF-RL presented to the anode by the parasitic resonance. This is done by decreasing the VHF-Q of the parasitic resonance circuit. In other words, to decrease Q, increase R. Traditionally this has been done by winding a Cu wire coil around a carbon-comp resistor and soldering the coil in parallel with the resistor. In a typical 2. 3-500Z amplifier this configuration produces a Q of c. 5 at 100MHz. Misfortunately a Q of 5 is not quite low enough to reduce VHF gain enough so that oscillation can not be sustained It apparently takes a Q of 2 at 100MHz to achieve

acceptable VHF stability. One way to decrease Q involves exchanging the highly-conductive Cu wire for highly-resistive Ni-Cr wire   This simple change results in a Q of c. 2 at 100MHz as measured on a HP 4191A Z-analyzer.   By using two Ni-Cr VHF suppressors per 2-500z, Q can be further reduced to c. 1.5.
- end

I dug out my notes to find out the specifics. My counter is an HP 5334B with Option 1, the high stability oscillator. The oscillator is one of the HP 10811 series. The original thermal fuse, F1, was rated for 108 degrees C. HP revised the part to one rated for 115 degrees C, part number 2110-0617 (10811-80003).

The Radio Shack thermal fuse was 270-1322A, rated for 128 degrees C. There is also an NTE Electronics NTE8115, "Thermal Cut-Off", rated for 117 degrees C. Either is larger than the HP part, and is a tight fit.

I wrapped them in electrical tape to protect against short circuits. When soldering to the high-value resistors, I clamped the fuse leads in a pair of pliers held with rubber bands.

Of course this may not apply to your counter if it doesn't have the crystal oven!

Fred

Thanks Fred! I haven't had time to dig into it yet as I'm out playing
on 10 GHz this weekend. Fortunately, I have a second 5245L for
comparisons. I did find the capacitor on the oven as you mention, but
it did not have enough range as you noted. If the heater is working,
does the enclosure get warm? Seems to me that as I was feeling around,
it was ice cold on the outside. Maybe we're onto something here!

Yes, mine has the oven (and the high stability Oscillator option). I've

gotten some good leads on this problem, so when I get a bit more time,
I'll rip into it! Thanks again!!

By the sounds of things, a telephone with a mute button is really what you're after. A lot of cordless phones with headset jacks have such a button.

Alternatively, have you considered a voice modem connected to a computer, and just plug a headset into that? Some modems can act as a telephone when fed the right AT commands -- to mute, just unplug the microphone, or wire in a series switch.

The difficulty you may strike using a CB microphone on the telephone is largely due to most phones (around here at least) use an electret type microphone capsule, which has different characteristics to the dynamic microphones typically used in CB microphones. There are circuits for interfacing a dynamic-type microphone to a circuit that uses an electret microphone -- such as computer sound cards, this is the sort of thing you'd have to look into.

In addition, you'll also want to check that what you propose to do is legal. Yes, there's a high probability that if you do everything right (technical sense) then no one will notice and you'll get away with it, but this is dependant on the local laws and authorities in your area, some of whom may be more proactive in looking for and acting upon such activities.

Nostalgia aside, I really do think you need to consider whether this is *really* necessary, or if there's another (perhaps better/easier) way to go about doing things.

It's still visible on Google Groups where I read, and replied to, your post. It's worth pointing out, as others have, that this really isn't an amateur homebrew discussion as such, but rather one relating to microphone interfacing which is slightly offtopic.

Nevertheless, you'll find your query and my response here:

I seem to recall that there is a second adjustment inside the plug-in
area. I assume you found
both of the adjustments.

I did see a fairly large air variable capacitor sitting next to the oven
assembly, but since I didn't know what it was for, I didn't adjust it.
I'll go through the manual I downloaded and see if I can get it on
frequency.  Thanks for the note.

Scott,
Those capacitors inside the plugin bay are medium and fine frequency
adjustments. If the coarse frequency adjustment inside the oven won't get
it on frequency, then the others certainly won't have enough range to get it
right.
As I and others have suggested, you really need to verify whether the oven
is being heated before you do any more adjusting. Set the coarse tuning
back to its starting position and troubleshoot the oven circuitry. I'm
convinced that's where you'll find the trouble.
Get your voltmeter out and check the oven heater connection. It will tell
you a lot.

Greetings,

I would appreciate any citations to projects (etched boards, layouts, anything that has been tested) for a small wideband amplifier with hi-Z input (1mV -> 100mV), AGC (over full gain range), 50 ohm output, approx. 100kHz to 440MHz bandwidth with min. 15dB gain; the intent is to provide a low impedance, leveled output from cheap old signal generators (for setups to measure antenna impedance, circuit Q, manual spectrum analysis, etc.) Ideally, the AGC circuit would employ an external level set control and three LEDs which indicate underrange, locked and overrange respectively.

One would have thought that this would have been a popular item what with the thousands of old Dynascan, EICO, Heathkit, etc. generators still in the wild that have hi-Z unleveled outputs.

It could be built with discretes, but an AGC wideband IC makes sense, such as the SL6140 (which is probably hard to find) -- recommendations for any other device? Perhaps someone can point to some set-top box, sat rcvr, cable tuner, etc. that may have something to use?

Thanks,

Michael

Over what range of output would you like the circuit to operate? I suppose a 10dB range from, say, 0dBm to +10dBm would be appropriate. You say "hi-Z input," but by the time you get to 440MHz, it doesn't seem like the generators will have a high impedance output. Most of the parts I can think of that would be helpful are already 50 ohm, or similar, input. Maybe that's more because I deal mostly in 50 ohm systems than that the parts aren't available. You didn't mention if distortion (harmonic) is important, but I suppose so, and in fact, the AGC loop should be so slow that you can pass AM modulation down to pretty low frequencies.

It could be done with a small hand-full of parts, certainly: an MMIC amplifier with an appropriate voltage divider at its input to get to a higher input impedance and a reasonable level to drive a double-balanced mixer (or similar; to control the level); another MMIC at the mixer output to give the desired output level; an RF power detector IC (suggest a Schottky-based one like the Linear Technology LT5507, rather than a log detector, for this application) and a low frequency amplifier/filter back to the baseband port of the DBM to control the level. That's not a whole lot of parts, though there may well be something closer to a single chip solution. However, a lot of RF ICs don't cover down to 100kHz, and a lot of low frequency parts won't go to 440MHz. I've played with a nice little 4-quadrant multiplier IC from Analog Devices that would do the gain control part quite nicely: ADL5391. Actually, its input impedance is probably high enough to use directly with your sig-gen output, though the generator's output level may be a bit too low for optimum performance. Also, beware that the output impedance of the ADL5391 goes up with increasing frequency.

Hope this is useful food for thought...

Cheers,
Tom

Yes, most certainly the oven should be noticeably warm, unless your ambient temperature is already really hot. You can also monitor the current the oven draws (perhaps with some difficulty, depending on how the oven is wired into the circuit). You should see moderately high current when the oven is first turned on, and the current should drop to (very roughly) half as much as the oven reaches operating temperature. I'd expect the oven control loop to be reasonably damped, so the current falls from the startup value to the idling value within just a few seconds and stabilizes without overshoot, or with only minor overshoot. At least that's what I've seen on several models, including the HP10811.

These days, you can get some remarkably small and low-power oven oscillators, down to TO-5 transistor can size I believe, and possibly even smaller. The power to run them is low milliwatts. Even temperature-compensated oscillators have gotten remarkably good...I have some 3x5 millimeter ones that are rated half a part per million max deviation over -20C to +55C (and run on about 2.5 milliwatts), and you can get better than that.

Cheers,
Tom

Hey OM:

I know for sure MMIC's been around quite sum time. I used to make a living selling them back in the 1980's to people building HBO boxes. There's got to be plenty of apps out there. I mean wideband DC to 2.5Ghz 12db gain +-3db across the whole bandwidth.
There's a tonne of them out there. Mini Circuits is just one famous manufacturer.

Yup...I will delve into the oven circuitry when I get a chance...have a
couple other higher priority projects to clean up first...

I don't think it's POSSIBLE to get REALLY HOT here in WI (by some
standards, that is...to me, 75 is really hot!)

;)

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |

```
is that it does not mention newer amateur radio newsgroups created since      |
it was written, including:                                                     |

 rec.radio.amateur.antenna                                                     |
 rec.radio.amateur.boatanchors                                                 |

I bought 3 old cell phones at a yard cell the other day to tinker
with. These are GPS equipped. I was wondering it would be possible to

take a signal off of these I could use as a time reference. At work we have such a reference that supplies 10Mhz, 1Mhz 1 Hz and I think there are other frequencies. I opened one up and dont have a clue to what any of the chips do. Any help would be appreciated.

Jimmie

Rather than beating your head against a wall trying to figure that out, why not look into a GPS module? You can get a Garmin GPS15 for less than $50.

https://buy.garmin.com/shop/shop.do?cID=157

I'm sure there are similar products from other makers.

Bert,
My take on your plan is that it's a losing battle. Cell phones are not
really designed with frequency standard capabilities in mind, and it's
rather far-fetched to think that you could easily find a 10.000000 MHz
frequency inside a cell phone. Even if you could find a stable reference
frequency inside a cell phone, you would likely need to build a good bit of
circuitry to get it back to 10 MHz.

I suggest that you search for Thunderbolt GPS on Ebay. Made by Trimble, the
units are GPS-based frequency standards that output 10 MHz and 1PPS signals.
They were built for the cellular industry, but unlike the cell phone, their
lot in life was to be a real frequency standard.
You can find them for approx. $100-$150 USD on Ebay. They are quite
reliable and are ready to run. You only need a GPS antenna and a PC with a
serial port to run them. After getting them set up with your PC, you can
disconnect the PC and it will run unattended. The software is free.

I was hoping whether frequency standard or cell phone I was hoping
they all used the same chips. No such luck I guess.

Jimmie

Cell phones have a very high level of integration. In many
phones, there's one RF chip and one for everything else,
and in some, it's all on one chip. Basically there's nothing
except perhaps the display that you can hack.

That contrasts with the early ones, that were a great source of
parts. Even a decade ago, I was still finding the early cellphones,
in big clunky cases, and pretty much all the parts were recognizable
and thus reusable. NE560 compander ICs, 8bit CPUs that could be reused,
IF strips that were often on a small board that could be easily extracted.
TCXOs, crystal filters suitable for use as roofing filters, just lots
of good parts.

I'm not sure where the cutoff point was, but the smaller things got
the less they had parts that were recognizable. Any recent cellphone
has virtually no components, and none are really recognizable and
certainly aren't useful for other purposes.

Even cordless phones seem to have gone that way, a decade ago when
they were still down at the 49MHz range, there were plenty of good
parts, but when they migrated to higher frequencies they got more
integration and fewer useful parts.

hey OM:
There sure are alot of nay sayers here for sure.

Back in the day I used to repair TV's,.Now back then, in sum TV's they
took the NTSC color burst frequency off the IF via a filter, now true
it was a quartz crystal filter.
Wouldn't take much to use a pick up loop and a 10 MHz broadband filter
to pull off the frequency standard in a cell phone.

Was also going to suggest an ex-microwave oven transf. Have a number
of scrapped microwave transformers.
Here (Canada) I've checked the ratio between the 115 volt input
winding and the secondary and it's close to 1:20.
In a 230 volt country I guess it would be around 1:10???
The secondary is therefore around 2200 volts RMS. That's toot high;
but if that was half wave rectified through a single diode with a
choke input filtering circuit etc. and capacitors with sufficient
voltage rating you might end up with a suitable 1300 volts or so?
Alternatively various methods of reducing the input voltage from 115
or 230 volts could be experimented with. Voltage bucking (opposing),
removing turns from the secondary or maybe even some sort of voltage
dropping circuit in the input winding?
Of course the 811A needs heater voltage from somewhere as well!
Just thinking out loud!

Hey OM:

The secondaries of microwave oven transformers make great chokes.
Been there done that.
I've even used them in a pinch on a 13.8 volt power suppy when the
regulator blew out.
Off of 24VDC peak ripple of the 13.8 volt power supply, the primary of
the microwave oven transormer did a great job dropping the voltage
down to 12 volt with no hum after being filtered, just no regulation.
It did a great job choking my 13.8 volt power supply. And running my 2
meter all mode Ten Tec.

You don't need a big filter cap either btw.

73 OM

Hi Guys
The 144 MHz receive rf amp transistor had a mod which replaced the original with a BF982.This transistor has been discontinued and i was wondering if there was a more modern equivalent with a lower noise level.The BF982 is an N channel dual gate 20v 40ma to 200MHz. Any helpful suggestions would be appreciated.
Cheers
Steve VK4ADA

I took a quick look for crosses. The combination of 20V 40mA 1.2 dB
noise is quite difficult to match.
There are lower noise UHF devices but they tend to have <20V or < 40ma
max ratings.
Perhaps you should just do the search for a BF982 supplier. They can be
had, though you might pay couple or three bucks for one.

Many years ago when I was a teenager I remember a guy that was
building a push-pull grounded grid amplifier using 8 *811As. I never
got to see if he finished it or not. The only info I have found so far
is little more than an acknowledgment that such a circuit exist. Any
further information would be appreciated.

Jimmie

I never did get a chance to see if my idea would work, I found a
```

suitable replacement transformer and then gave up on the idea until next time. It did seem that getting enough wire wound in the core could be a problem. It may be possible but I don't think that the 1KW transformer I had could be used at that power level. I guessing at maybe 30 to 40% of the max .

Hi all I'm a newbie here.

I have my first question:

Whats the difference between these two models TEKTRONIX 2215 and the 2215A?

I won a 2215a on ebay and just wanted to know what the A in the model# meant.

Thanks

Jim

I would see if I could download the manuals for each one and compare.
Sometimes the A model will have a few more bells and whistles or be
faster.

I have a couple of BF981 if they are a suitable substitute, new old
stock, for sale on eBay at the UL below.

Charlie.

Hey OM

Sorry to see you had to post in the homebrew group you must be desperate.

I want to know why you want to know what the difference is, what is the reason for this question?

Lastly back in the day when they made such things mfg's always updated/ upgraded their products.

Just so they could justify the high price, they added more features or improvements onto them.

So to answer your question directly they improved on the 2215 so they named it the 2215A. I can tell you it won't be much of an improvemnet just that there is some slight difference.

I used to   make a living selling electronic equipment. paticularly oscilliscopes.

Though I may be wrong (I often am) a Grounded grid push-pull is not
possible. But I would suggest downloading the manual for the Ameritron
AL-811H amp. It only uses 4 of the tubes but adding another 4 would be
quite simple based on repetition.

Hey OM:

Give me a break, there is know way the front end is going to use 40 ma
of current. What the heck do you think it's driving the freaking audio
output?

Firstly they aren't going to be using the front end in anything but
class A. That makes the only parameters you have to looky at. are
Vds, gain, Ft, and noise figure. Forget about Pd and Ids. Just looky
at the drain resistor, says it all.

Hey OM:

Find yourself an old RCA/GE TV, well a few years old. Like with a CTC103 and no earlier than CTC77 chassis, yank the UHF front end transistor out of the tuner, it'll be the one closest to the RF jack. The VHF front end is good to 216Mhz and the UHF is good to 900Mhz. And they are all N channel.

I wouldn't worry about noise figure at 144Mhz unless you are doing EME.

I used to make a living repairing RCA/GE tuners

I need to buy a probe for my oscilloscope which is 60 MHZ.

My question is can I buy a probe that rated 100 MHZ or must I make sure
it is rated 60 MHZ the same as my system?

Thanks

The 100 MHZ probe will work fine.  The 60 MHZ specification on your
scope means its vertical amplifier and display will start to degrade
at 60 MHZ or higher in frequency.  Therefore using a probe with a >60
MHZ rating will allow you to realize all of your scope's capabilities.

I have a couple of Variac cores less the mechanical wipers. I was thinking of using the Variac as the primary winding and winding the secondary transformer over it.. I have my own ideas about how I would procede with this starting with given the old coil a new insulting coating, maybe Krylon HV coating . Secondary would either be wound for 540VAC or twice that. The transformer this is replacing was a 540vac transformer feeding a voltage doubler. Any ideas and suggestions would be greatly appreciated.

===============================
Yes that could be made into an effective 'toroid' transformer.
Good insulation between current 115/230 winding and secondary winding is crucial. Don't know what Krylon is ,but a sheet type insulation seems very necessary
Suggest you first try with a low secondary voltage
Also check max power   of original variac at 115V input and compare with the HV power required.
Example : If variac was meant for max. 4 Amperes at 115 V ,ie 460VA the secondary pick-off should not exceed that value.

The tuned tank circuit isn't generating the RF energy, it's just selecting the energy you want.

Interrupt an arc and you get lots of harmonics tied to the interruption rate, going way up. Run it through an RC filter and you can select the particular harmonic you want to transmit, shunting the others to ground (and throwing most of your power away in the process).

The Poulsen used a continuous arc which generated white noise.... you filter that noise out and you get a signal that is narrowband... and the narrower you filter it, the more power you lose. It's a lot less efficient than the rotary, even.

>Federal
>Telegraph held Poulsen patents and exploited them in series
>of wireless telegraph stations mostly on the West coast of

The Alexanderson puts out a very nice note.... the problem with it is keeping it on frequency, not phase noise. Oh, also keeping it from flying apart and exploding is another issue. It's a far higher tech device and much more difficult to make... and also not so effective at higher frequencies.

I was thinking of spraying the area where the wiper made contact with
the Krylon HV insulating coating an then wrapping on a couple of
layers of Teflon plumbers tape before winding on the secondary.

I'm trying to download a copy of the manual, but at the rate it's downloading, I may have it by Tuesday, April 27th.....2013!

Anyhow...does anyone have a copy of how to set the timebase oscillator frequency? I measure the signal coming out the back of the counter (with another counter) at 10.000066 MHz. I adjusted the "coarse tune" adjustment on the back of the unit and this is as close as it gets to 10.000000 MHz, so I assume there must be some other adjustment somewhere...I took off both covers, but any adjustment control is not blatantly obvious....

Scott

Hey OM:
Here in the USA a TV transformer with those specs would have to be 50
years old.
I used to make a living replacing those transformers.
An MOT might give you 2300VAC unloaded.

Even at half wave it still has to be filtered
and with just capacitive filtering you end up with ripple depending on
the load and peak VDC of 2300/0.707

The number of poles is part of the issue, but you'd think with modern
machining technology you could make a big rotor with maybe a thousand
poles.  Problem is that if you do this, the capacitance kills you.

One possibility to run an Alexanderson alternator would be to run it
into a nonlinear device and then select one harmonic out.  Again, it's
very inefficient....

> N0EDV

Scott,
I've seen the oven temperature control circuit more likely to cause this type of problem. The fact that the oscillator is working eliminates a lot of circuitry.

Before you do any more adjusting, do this:
Check that the oven temperature control circuit is working. Check to see if the collector of Q1 is in the ballpark of about -21 volts. That point should start out (cold oven) at around -5 volts or so, and go toward -21 volts as the oven warms up. If it stays at the lower voltage, you have a problem with either Q1 or one of the transistors on the oven control assy A25. That same reasoning goes if the voltage at Q1 collector starts out and stays at -35 volts or so.
An extreme cause would be that of the oven heater being open. In that case, the oven assembly is bad, and will need to be replaced. You can attempt ot disassemble the oven and repair the heater, but it's iffy. One of the temp sensor components inside the oven might be bad as well.
If the oven and the oven control is OK, that means that the oscillator is out of tune. That could be caused by the crystal itself, of one of the capacitors inside the oven.

I have an operable oven assembly that we could make a deal on, but since I recently moved from Florida to Alabama and don't have a shop area yet, it's still in storage. If you can wait for a couple of months, I could dig it out for you. You might look on Ebay for an oven; I've seen them offerred there, but not often.

I don't think I'd use plumber's tape... it's too flimsy and easily torn or
punctured. I think I'd use a piece of cardboard cut into the shape of the
exposed variac winding and taped in place with high temperature vinyl tape.

Very elegant!   And no, I believe that photo etching a thousand poles
or more on
a copper-clad should be very possible with laser printing of the
master. The manufacturing
technology wouldn't be steampunk even if the results are :)

Hey OM:

At 50/60 Hz, Kapton tape is your best bet, over 5000 volts per mil. So
a 2 mil thick tape would give you 10 kilo volts of protection. I
bought sum sheet Kapton on ebay it was rated 7500 volts for one mil
thickness.

I'd get a 1/2 inch wide tape and wrap the toroid twice.

73 OM
de n8zu

============================
Indeed Kapton tape (tnx N8ZU) is the stuff ,the name of which I couldn't
remember ,which is best for this application .

Frank

Sounds like re-inventing the Alexanderson? rotary alternator
transmitter in Scandinavia?
By the way 167 thousand cycles (167 kilohertz). Is right in the
European 'Long Wave' broadcasting band! For example BBC is on 198
kilohertz just slightly longer than 1500 metres wavelength! (1515
metres).
Not sure what is the point of electromechanical frequency generation?

Sounds like re-inventing the Alexanderson? rotary alternator
transmitter in Scandinavia?
By the way 167 thousand cycles (167 kilohertz). Is right in
the
European 'Long Wave' broadcasting band! For example BBC is
on 198
kilohertz just slightly longer than 1500 metres wavelength!
(1515
metres).
Not sure what is the point of electromechanical frequency
generation?

More like the rotary arc. The Alexanderson was a high-frequency alternator producing pretty pure CW. Several very large ones were built (200KW) operating at long wavelengths, perhaps up to a couple of hundred Khz. Some remained in service for decades.

Rotary arcs were used to generate modulated waves, so called MCW so that the detected code could be read without a modulator at the receiver. Typically they had interruption rates on the order of 500 hz. They were often called "rock crushers" because of the terrific mechanical noise they made.

Excuse me for seeming a Patronising Old Bastard here, but I feel some
basic radio theory is in order here, and to respond to the original
question......

Quote.
 I measure the signal coming out the back of the counter
> > (with another counter) at 10.000066 MHz.

Response.
How accurate is the frequency counter you are using to measure the
10Mhz TXCO? (and does it have a current calibration certificate?) -
unless it is at least an order of magnitude BETTER than the HP, any
results will be meaningless. Your comparing the HP ref. signal
to......what?....

A easier way is to zero beat the HP TXCO with WWV. Yes, for the
purists, there are problems with this method, (which are NOT relevant
here) but if you tune for zerobeat by ear as best you can - by then,
the S meter should be pulsating (it can see the beat note, you cant

hear it) and then tune.

Get really hi-tech, use a GPS locked counter.

And I hope you took notes of the original "frequency" and can take it back to this. Its a well aged, ovenized xtal. It will be pretty bloody close, unless someone has been into it before you.....

These things were, in their day, laboratory grade instruments. They still are, but have been superseded as technology advanced. You need to learn what the display is telling you, and how much is relevant to what you do. Its unlikely that you will be building something that needs 10>-12 accuracy. (A nominal figure, not going to dig the manual out to look)

The error you quote is totally insignificant for average amateur (and most professional) use.

If the oven is working, it will get warm. Simple.
Plot the frequency change from cold switch on - see how long it takes to stabilise. Do it again, later, when the ambient room temperature has changed. If no shift, its OK. And if it is not working......well, they ARE fascinating instruments, the service manual a joy to read. (Bout the size of the phone book) They even give Boolean equations for it. You could be entranced by 1960's technology - if you so choose. <g>

Later model ones had a "Oven"light on the front panel - if it was out after warm-up, then it was ok. BTW - anyone got a service manual for a HP5248L counter.......got a gating fault, how similar are they to the 5245L - any HP test gurus out there?

In good faith, and hopefully no insult intended or received.

Andrew VK3BFA.

The 5248L manual is on Agilent's site at
http://cp.literature.agilent.com/litweb/pdf/05248-90001.pdf. I can't say how
similar they are to the 5245L, but the DCUs seem to be the same. I used to
be a calibration tech many years ago, and while I saw many of both
instruments on my bench, I rarely had to repair them; quite reliable. I
remember two cases where the counters exhibited the exact problem the OP
has; significant oscillator error. Both turned out to be problems with the
oven control circuit.

I have to disagree with your statement that the OP's error is insignigicant
for professional use. That might be true for some hobbiest uses, but for
many amateur radio operators and certainly for professional use, it's a
very significant error.   The original time base spec for the 5245L is
3x10^-9 per day.

David, than you for the link - will try for it, and hopefully it can
run overnight here. I stand corrected re accuracy - as I said, I
should have dig out the manual, (and, indeed, revise my own theory re
where the decimal point goes) a bit better.
I was hoping someone like you would stick their head up - helps to

talk to someone who has actually worked on them as a job.....thanks
mate, appreciated.

Andrew VK3BFA.

Got it! - thank you. Paid $5 for it as an "under the table" item at a
Hamfest. Missing 2 front panel knobs, but will get it working properly
before I chase them. Got several plug ins for my 5245L, will
investigate if they are compatible..
Still a nice bit of gear....

Andrew VK3BFA.

Frank, I am trying to decide on a wire to wind the secondary with. I
was considering using the wire from some cat6 cable. It appears to be
rated for 1.5 amps per the information I have seen on the internet.
Cat5 is rated at a little over .5 amp. I think current draw will be
around 300 mil at the most.

Very accurate. It is our Agilent power meter/freq counter (to 26 GHz)
and has been cal'd.
>

Yes, I did note the original freq.

Well, I'm wanting to measure down to about 10 Hz "accuracy"...in other
words I am measuring 189.XXXXX MHz. This is the XTAL freq. for my
microwave LO that is multipled by 6 to get to 1136 MHz and that is

multiplied by 9 to get to 10224 MHz, for a total multiplication factor
of 54.
>
> If the oven is working, it will get warm. Simple.

Now THAT'S something I need to check. It should be working...the unit
is only a bit over 40 years old! ;)

> Plot the frequency change from cold switch on - see how long it takes

None taken. I work on microwave equipment at work all day long and can
get a bit worked up about "being on frequency" ;)

Thanks for the tips...the manual did finally download, so I'll dig into
it soon (the good news is I have two of these, so maybe I'll check the
other one and see how close it is. I just bought the second one for its
3-12 GHz mixer).

The oven has been mentioned in a few posts. I will try to establish if
that is working or if that's where the problem lays. I want to use it
to count my 189.XXXXX MHz XTAL freq in my 10 GHz transverter. I need
pretty good accuracy since this XTAL is multiplied by a factor of 54 in
the LO chain. Thanks for the tip!

Scott

QST had an article on GPS frequency standard. Something you might want
to check into. I think it was a construction project.

Jimmie

Hey everyone! First time poster here.

I was wanting to convert a CB radio into a telephone. I don't want to
use a patch, just replace the CB's innards with telephone so I can use
the CB in place of my current phone. I know dialing would be difficult
but I can always use one of the other phones for that. Basically, I
figure I can use the on/off toggle (or another toggle) to pick up the
line, use the mic as usual, etc. I do a lot of work from home and I
thought it would be pretty cool to be able to use an old CB with the

added bonus of not having my voice transmit when I'm holding the PTT button so clients, co-workers, etc. won't hear me when I laugh at the dog or something, lol.

Has anyone ever done something like this before? If so, can you point me in the right direction? Currently, I haven't started the project yet and haven't bought any of the equipment so it's a blank slate so far. I was looking at getting an old CB off ebay or something for the unit. Any help y'all could give me would be greatly appreciated.
Thanks and have a good one!

Well, it certainly shouldn't be too hard to do. I think the 5245L uses
a 1 MHz signal for the external timebase input, so it might just be a
matter of dividing the 10 MHz output signal that the GPSDOs that I'm
familiar with and supplying it to the external timebase input...

To check number of turns and hence total length of wire required for
say 2x540V=1080V check number of turns by temporarily winding 10 turns
and measure secondary voltage .

If you wish to draw up to 300mA at 1080V the rating is to be not less
than 350VA . The existing variac must be able to deliver that.

Both cat 5 and 6 cable has (plastic?) insulated wire not teflon. So
there might be a max temperature problem affecting the insulation .
My suggestion is to source good quality enameled wire and make secondary
winding with 1 length of wire, not with a number of shorter length
unless each shorter length is connected outside the secundary winding
envelope (so joining several lengths and insulating the joints with for
example heat shrink is not recommended)

An interesting project ......good luck

Frank GM0CSZ / KN6WH

Hey OM:

Back in the day I used to make a living selling Kapton coated magnet
wire.

That stuff was so great, we used to say that the copper would melt,
before the Kapton insulation would turn to carbon.

I guess I will have to get a couple of rolls.

Jimmie

>Jimmie

I would figure out how much wire I need and run to a local motor rewind
shop and purchase wire from them. It has been my experience that most
shops are now using a higher temp. insulation than they were 10 or 15 years
ago.
I think VFD motor systems pushed them to do this.
I would ask about some of the (paper) type material to put over the exposed
windings where the wiper slides, then wrap the primary with Kapton tape.
 http://www.can-dotape.com/kapton-tape.htm
 I have even purchased a quart of the varnish they use and used it to help
protect
the wire from vibrating. I baked it in the wifes oven (when she wasn't
home!)
 I think you will need a lot of turns, for a 540V secondary I figure 4.7
times
the number of turns on your primary. Count the number of turns on the
primary
and multiply by 4.7. I do like the test of putting on a good number of
turns to check
volts per turn, to get a ballpark number. The heavier your wire the better
regulation you will be. You can calculate the voltage drop of the wire in
your secondary with
the heap of a wire table. http://www.powerstream.com/Wire_Size.htm
 Let's say you used 22gauge wire with 16 ohms per 1000 feet. and let also
say you
need 500 ft to wrap your secondary. So your secondary has 8 ohms of
resistance, you said you would draw about 300ma. So E=IxR or

```
.3A x 8 ohms = 2.4 Volts. Not much drop. Let's try a 30 gauge with 103 ohms
per 1000 feet.   .3A x 51.5 ohms = 15.45 Volts. Higher but still only about
3% of
 540 volts. This is calculated at 540 volts at 300 ma, I'm not clear if the
300ma
is at 540V or 1080V so you may need to double the voltage drop of your
secondary. Remember this is only your secondary wire loss, not the primary
or core losses.
                   Hope that helps, Mike

Thanks for the info Mike. I was able to compare the size of my core
with one of a known rating(1KVA). The core I am going to be using is a
little larger than that one.

I posted a simple enough question about converting a cb into a telephone and it's been removed. Anyone know why?

Its still here on my news service. I don't think anyone *removes* posts
on Usenet.

You are posting to Usenet via RadioBanter. Maybe they have something to
do with it.

-Bill

First, the question didn't belong here, it's not even radio related.
Far better in sci.electronics.basics, but even then I have doubts, since
it's not an electronic question.

Second, there really isn't an answer. Rip out the existing electronics,
then take a cheap phone from the drugstore and take the circuit board out
and mount it in the CB set. It's purely a cosmetic issue.

You can calculate the voltage drop of the wire in
> your secondary with
> the heap of a wire table.http://www.powerstream.com/Wire_Size.htm

Hey OM:

That link to that table is ok. I learned building my own transformers.
Heat is the killer of any design.

What those tables don't tell you is the resistance increase caused by heat which turns out to be run away in cases. It's like the resistance goes up because of heat and this creates more heat increasing the resistance further.

Leave a fudge factor in there, use the largest size wire possible

73 OM
de n8zu.

URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Actually, I DO know the answer, and it is NOT in compliance with
Title 47, Part 95, SubPart D, 95.420, UNLESS, Station Owner complies
with the complete Rule, as Amended... which sets very strict provisions
for such an interconnection.

sorry Mike, Would you like to try again, for what's behind Door #2.....

Scott-

I have a different HP counter that had a similar problem when I got it. There was a capacitor adjustment in the crystal oven, but it did not have enough range to bring the oscillator to 10.0 MHz.

It turned out that there was an open thermal fuse in the supply line inside the crystal oven. It was a plug-in device about the size of a half watt resistor, maybe smaller. There were two wire-sockets that its leads plugged into.

I managed to buy the last thermal fuse HP had in stock at the time. Before it arrived, I had fabricated replacements using a thermal fuse from Radio Shack, wired in parallel with a high value resistor which had the correct lead diameter to plug into the wire sockets.

Using a rubidium oscillator purchased on E-Bay, I aligned the repaired oscillator fairly accurately using an oscilloscope. After several years, it seems to still be within a fraction of one Hz!

It turns out that this is a common problem. I wrote it up and sent it to QST for their Hints & Kinks several years back. Since then, one of the HP designers of the oscillator posted a comment that the thermal fuse wasn't really needed, since the heating element shouldn't cause any damage if left on continuously. Even so, I feel better with the thermal fuse installed!

Im thinking 20 gauge enameled wire mostly because I think I have a
1000 ft roll in the attic. Not at all sure how well that is going to
fit on the core. I really want to get away from the voltage doubler in
favor of a bridge rectifier so I want to wind it for 1100 volts.

Jimmie

You really need to do some math before you start winding wire onto your
variac core. Read the theory and do some practice exercises from the info
on these web pages:
http://how-to.wikia.com/wiki/How_to_build_a_transformer_or_inductor and
http://www.howyoubuildit.com/transformer/

You have a finite winding area in the center of your toroid. Wire size will
define how many turns you can get into that winding area. You might find
that AWG 20 is way too big for the secondary voltage you want.

Cheers,
--

Hi,

You could use an LTC3704 for example
(http://www.linear.com/pc/productDetail.jsp?navId=H0,C1,C1003,C1042,C1033,P1728)
to generate -5V and use a similar LT device to give you +5V.  Linear
```

Technology produce quite a wide range of these interesting regulators.

Thank everyone for replying. But my question seems not been understood correctly.

I want +5V and -5V output simultaneously with common ground in one circuit. Not individual +5V or -5V output, one at the time.

That is, if I use +5V terminal and -5V terminal, the voltage difference should be +10V.

Thanks.

The NE 555 circuit will do that given about about a 25ma current limit
otherwise there are a number of DC to DC converters commercially made
power blocks that will do it. Packaged Power makes some nice little
units. I have a Bipolar unit on my desk 12in +/- 12 out

Your question misses one essential information: how much current
do you need from those outputs?

There is a big difference between a solution for a couple of mA
and one for several A.

This is a hard question to answer without knowing more about your application -- can you describe the circuit you're providing a power supply for? How much current does it need to draw? How sensitive to noise is it?

Do you care about the output ground being the same as the input ground? If not, you can use a rail splitter (e.g. a TLE2426, or a pair of resistors and a buffer) to give you an output ground rail midway between your inputs, which'll give you a +/-6V supply from 12V input. If that's not close enough for your application, you can then regulate down to +/-5V using low-dropout linear regulators. This is almost certainly the way to go if you just need a split-rail supply to drive some op-amps.

If your input ground must be the same as your output ground, then there are a variety of cheap, efficient buck-boost regulators you can use to get the two rails you're after, but you'll need some external inductors, and you'll have to worry more about noise...

you could certainly layout a multivibrator working at say 1 kHz.

And you could make its output drive four steering switches - MOSFETS or power transistors, to switch on the top and bottom of a flying capacitor which charges to 11.4 volts on one half cycle, and disconnects the source on the other half cycle, but instead connects the the top of the flying capacitor to a zener rated 6.5 volts connected thru a resistor to ground. This puts the top of the flying cap at about 5.5 volts, and the base of the flying capacitor at -5.5 volts.

The multivib also connects the top of the flying cap to a smoothing cap via another switch, which provides a little over plus five volts. Meanwhile, the foot of the charging cap drops to -5.5 volts, which connects via a power diode to a smoothing cap for minus 5 volts.

This takes four power steering switches, a zener and a power diode, along with three caps. Not to mention the multivibrator and its coupling caps.

This is more complication than is really needed, but you would probably enjoy the fairly straight-forward design challenge. Or would you?
:-)

You can do it with one, especially if you let the ground fly (even the
MC34063 can do that) but I found that I can get better noise performance
using two. AFAIK the LM2673 is positive, the MAX is unobtanium at
Digikey (as usual ...). Anyhow, if Jane does ham radio then noise
matters a lot. Shielded inductors are only shielded on paper unless they
are toroids. There's usually an epoxy gap, fairly big. Of course they
often use black epoxy so it looks better :-)

Good point, for very low currents a charge pump can work. Jane might
even rummage through the junk box and find an RS232 chip with a charge
pump on some old modem card. Those often contain an on-chip charge pump,
if that's enough current.

> Suppliers web sites to visit: you might add Maxim to Joerg's list.
> (There are lots of others.)

I design electronics for a living and do not use Maxim parts. If it's
for a one-off project and I am lucky to find stock, ok, but not for
production. But that's just my personal opinion.

If you use one buck converter and one inverting converter then that will be the case. One ground, and +10V between the two.

You haven't said anything about currents that you needs. If a few
hundred mA you could do both with this chip, one per voltage:

That's like buying ready-to-bake pizza. Yuck :-)

But yes, you can buy those. Doesn't quite fit the charter of this NG (... homebrew ...) though. Also, I found many of those drop-in converters to be very noisy in terms of EMI. In fact, if we can't find a suitable one for a project I might have to roll one today, but higher voltage.

===============================
Had a look in my junkbox and found an octal base xtal oven as suggested
above.Make; Cathodeon Crystals Ltd  (probably British)
It can accomodate 2 crystals (probably rx and tx for a single channel
```

trx) ;the heater can be used on 6V or 12V .
Temp.control is trough bimetallic thermostat set at 75 C
These ovens are to be fitted with crystals with a glass envelope .

Hi Jane,
I suspect you may need to do some learning about power supplies, you will then be able to have some hope of understanding some of the Doctoral Thesis stuff you got for replies.

IF you can get to the AC secondary of the transformer, then you got a good chance - is it switch mode or linear your starting with? - switchmodes are usually lethal to the novice, leave it alone.

IF you cant get to the secondary winding of the transformer, your effectively stuffed, unless you wanna go off and study electronics for a few years.

So. There - hopefully relevant, and succinct.

Andrew VK3BFA.

I'm trying to come up with a filter or converter that takes a square wave input and outputs something closer to a sign wave (varying between ~1.9kHz and 2.1kHz). It can have some distortion, but I'm trying to eliminate the sharp leading and trailing edge. One option I'm pursuing is a bandpass filter (2 caps and 2 resistors), which looks to give a reasonable output, but still not quite as smooth as I'd like. I've also considered using a counter feeding a bank of resistors, but finding a method for it to start counting up with it hits 0 and down when it hits the high value might be more difficult.

Originally, I had used a wein-bridge oscillator with op-amps to make the sine wave, but due to the environment, EMI was a problem and it damped out the oscillations (even with ferrite beads and modest shielding). So I'd like to avoid using op-amps (since they are apparently sensitive to EMI) if possible.

Any suggestions?

Thanks in advance!
Dave

Use a 4017 counter, plus resistors.

Or, there are some nice 5-pole analog filters out there. Not cheap, but they'll do ya.

You could implement an up/down counter in a PAL. Doing it so that it up/down counts properly shouldn't be too hard.

Or use one of the myriad itty bitty processors out there -- PIC, AVR, whatever.

A lowpass filter is appropriate. You're trying to kill the higher
(odd) harmonics but there's no signal below the fundamental, excepting
DC maybe.

A dual-stage RC lowpass would be pretty good, if you set the -3 dB
point around 2 KHz. A higher-order filter, active or LC, would be even
better. An LC filter isn't unreasonable at 2 KHz.

John

Start with a triangle wave, there are less harmonics to filter out.
How bad is the EMI? I like the Wein-bridge. Try using an FET opamp
for it. The only problem I've had with the wien bridge was motor-
boating of the frequency. This was finally solved by using good low
dissipation caps. (Ohh I have seen EMI fuzz.. but only with BJT
opamps.)

George H.

One possibility is to use a digital filter. These have very sharp roll-offs (e.g. 8th order for MAX292), you basically feed the clock of the filter with a multiple of the fundamental frequency of the filter (say 64x), and the output is a very pure sine wave. The beauty of this is the amplitude of the output is independent of frequency and you don't have to change filter components:
http://electronicdesign.com/content.aspx?topic=microcontroller-based-sine-wave-generator-has-crys&catpath=test-and-measurement

Another solution is using a multiplexor to create an approximate sine wave

using an 8x clock followed by a filter (the example below uses a pair of
cascaded 2nd order filters). This may suit you better:
http://www.maxim-ic.com/app-notes/index.mvp/id/21

Mark.

Function generator. Integrate square wave to get triangle wave. Shape
triangle wave to sine wave using a couple of diodes. See

http://kitsrus.com/projects/k23.pdf

** Contrary to the OP's wishes, that POS uses op-amps.

Have you seen the ugly " sine" wave it produces ??

The diodes will rectify the RF energy.

Not even a starter.

... Phil

Not necessarily...They maybe for an indeterminate time, but as soon as
some one is using that portion of the band they will be liable if they
create any interference. OTOH the likely hood of creating
interference is slim even after these segments become populated,
unless they find public safety using them in their area.
I'd not expect to see anything actually active in less than a year and
maybe two. It's rare something like this moves quickly and
particularly with government.

There is a possibility of these being looked at like part 15 devices.
No interference, no worry. Interference means immediate stop, but that
appears to be well in the future.

Hey OM
You only posted in 3 groups? wft?
I mean if I was going to drum up some onlookers I'd go to the FCC data
base and email every single licensed ham radio operator.
But it won't matter some chicken bander will be the only sucker you
can find for that. In your description you say the tubes and fan light
up?

If the fan lights up you gots trouble.

Contrary to what you think, the OP seems like he would be happy with a sine wave with only 1% distortion. The diodes will rectify RF but at the output the signal level should be several orders of magnitude higher than the RF. So would not expect that to be a problem. The reference to the kitsrus was to show one implementation that had an explanation of the circuit.

I would make a five pole elliptic low pass active filter breaking at about 3 kHz with a deep 80 dB notch at the third harmonic of 6 kHz. This is a dual op amp (2 section) solution and uses a small number of resistors and caps. You should be able to attenuate all of the harmonics at least 80 dB leaving a pretty good sine wave.

Hello,

a Wien-Robinson bridge oscillator needs a good amplitude stabilisation.
If the amplification is to low, the oscillations will damp out. I guess
there was something wrong with your amplitude stabilisation.

Bye

Here is minimal solution:

http://www.abvolt.com/misc/square_to_sine.jpg

This filter makes for about 0.65% of THD; it is probably as good as it
could be done in reality with this number of components.

No, I used non-linear feedback (diodes) and it worked like a champ. O-scope showed a nice, rounded, stable wave with no clipping. It was only when the nearby transmitter was turned on, the oscillations damped out.

I modeled a few low pass filters, and think this is the best solution. I have 3 RC low-pass filters and the output looks relatively sine-like. Thanks to everyone that provided good suggestions! Here's the schematic in LTSpice (comments appreciated):

An inductor really does make a big difference for these kind of jobs
and only costs pennies.
I've tacked on an LC filter to your drawing.
Output is 5Vpkpk sine at very low distortion.
(filter is a 3rd order, Chebyshev, low pass, with 6db passband ripple
and a Zero notch at 6kHz. Components rounded to preferred values)
[replacement for LTlist...]

If a well-designed Wien bridge oscillator gets hammered by RFI, you're
somewhat depending on luck that an active filter doesn't have the same
problem.

```

Your RC values could be optimized. Try using successively bigger resistors and correspondingly smaller caps in successive stages. As is, each filter stage heavily loads the previous one.

These RCs each have an unloaded 3 dB point of about 2 KHz, so three in a row will lose about 9 dB. Making the taus a little shorter will increase output at the expense of distortion.

I'd expect a 3-pole LC filter to be a lot better.

John

Contrary to what you think, the OP seems like he would be happy with a sine wave with only 1% distortion.

** Fraid that POS has a lot more than 1% THD.

The diodes will rectify RF but at
the output the signal level should be several orders of magnitude
higher than the RF.

** The OP wants to link his device to a transmitter.

The amount of RF energy is serious.

Did you read his post at all ??

So would not expect that to be a problem.

** Yawnnnnnnnnnnnnnnnn....

.... Phil

That is a nicer output, but that also requires a 15mH coil.  Wouldn't
that be a little big?  This will be going into a small payload
container with 3" diameter.

Thanks Don. Truly weird! I plan to code it up and play around with this when
time permits. So, the original poster could put this into a single chip PIC
and forget about his square wave source. He'd still need to run a D toA to
get an analog output, would he not? Within that algorithm he could also pull
out a square wave too if needed. Frequency could be anything within the
speed of the processor with appropriate, even externally controlled internal
delays and of course be crystal controlled and very stable. Hmmm. I already
have a use for this. Thanks again.
Bob

They're about the size of 0.4W resistors but if you're stuck for space
then it's not an option.
I had in mind this ... 'Epcos' part#  B82144A2156J000
A pic of  a similar item ...
http://uk.farnell.com/epcos/b78108s1475j/inductor-axial-4700uh/dp/608646?Nt=
t=3D608646
Or a different body style but more expensive ...
http://uk.farnell.com/murata-power-solutions/22r156c/inductor-15mh/dp/10770=
44?Ntt=3D1077044

Hm, what about this one?  Looks promising:

```

The coil is a Caddell-Burns 6740-61 (6.8 - 12mH) variable inductor:

http://www.caddell-burns.com/PDF/A1042.pdf

You can use it to tune to 2kHz, dead nuts, but that tunability
comes at a price:

http://www.caddell-burns.com/priceList/Price_List_Pg_2.pdf

and the cap is any garden variety 0.68�F polyester cap.

I was going to start a valve project and wanted to purchase some hole saws for cutting out the socket holes. What sizes will I need for 7 9 and octal sockets?

I don't remember the sizes, but holes were never sawed for tube sockets. Instead of using saws, which are very difficult to control and make a mess of everything, hole punches were used.

The standard brand (at least in the US) was a company called Greenlee, which a web search says they are still in business. If you do a web search on "greenlee punch octal socket" or replace octal with tube, you will find several charts of which sizes to buy and people selling them.

Greenlee punchs are simple to use, you make center hole for the drive bolt. Being much smaller than the hole you need to cut, it's easier to make an accurate hole placement. :-)

Then you assemble the punch around the hole and tighten the drive bolt. It cuts through the chassis accurately and then you take it out, open it and remove the "plug".

BTW, don't repeat sending your messages. The chance of you ever seeing what you post, or at least quickly is very small. This is USENET, not a web forum (no matter what Google wants you to think).

Geoff.

Punches are certainly the way to go if you have some or can borrow some.
Otherwise its kind of expensive to have to go out and buy some for a
one time use.

An alternative is the 'unibit' type of drill bits. They make them large
enough for 7/9 pin sockets. See Harbour Freight.

GL with your project.

Try a high value resistor, say 47k into a pair of reverse paralleled germanium diodes to earth. The square law "knee" will clip the signal into a psuedo sine, around 1 volt p to p. Simple, and it works at these low frequencies. Three components, give it a try. cheers

Don't say never :-)

Greenlee chassis punches were much coveted when I was a kid. The
highschool radio club had a few (W3CDI, now apparently defunct), but
they were far too expensive for individuals to own.

I usually had to resort to drilling a hole with the largest bit I had
and then going the rest of the way with a rat-tail file.

=================================
For larger holes the RatShack nibbling tool is quite effective
,finishing the hole with a 'half round' file.

Without being a smart aleck, I have 1 question. "Sheesh, can't you get
a junk CB radio mike and find an 8 pin plug?" Surely the manual tells
the mike pinout, in fact I know it does. If you don't have the manual
get it from mods.dk.

"If you give a man a fish, he eats today. If you teach a man to fish,
he eats forever."

Look for greenlee punches.... do a quick tidy job. Require a 1/4 inch
hole to get them started.

Sure, I have the necessary skills to order a bnc connector, coax and
twin line, then realise (as I did) that I needed a different connector
which comes in five variants; but I don't have the
UHF antenna analyzer (do you, or do you just fumble it?) so I leave that
kind of effort to people who really really enjoy that kind of busy work,
while I get on with what I enjoy... <grin>

The Adel nibbler might be a more professional tool costing US$ 30 +,but
I remember having paid less than US$ 10 for the RatShack tool, which
very well satisfies my needs.

That's hard to believe! You'll be telling me next people go to a car
wash rather than getting a bucket of warm water and a chamois cloth out,
to wash their car....   <grin>

Let's get serious: this is the Land of the Free - Free to hire somebody
to walk your dog, clean your windows, and cut your grass....

Brian W

With a 10% of fc range i would use an integrator first then use an=20
active RC bandpass filter.

How many _well designed_ Wien bridge oscillators have you seen that get=20
hammered by EMI/RFI?

Metal is too thick for punches, Ive used hole saws before but I was
having a hard time finding info on the right size to buy. My set was
stolen. I eventually found them listed on the internet but had to look
on 3 different sites to find the 3 values I needed. Of course this
meant I had to look on about 3 dozen sites to find the info I needed.
Like a dummy I didn't think of looking in one of my old radio
handbooks.

Jimmie

As I remember, for Octal, it's 1 1/8 inch. I remember because the
only punch I bought was a 1 inch one. ;-(

For the sure thing, try a early '60s ARRL handbook for their suggested
tool list in the construction sections.

(Hmmmm, dig, dig, dig).
From the 1969 handbook, they have 1/2, 5/8, 3/4, 1 1/8, 1 1/4, and
1 1/2 inch punches in the Recommended Tools list.

Digging out a Newark Catalog from the same era, it looks like 5/8"
for 7 pin, 3/4" for 9 pin, and 1 1/8" for Octal.

Ive tried the Uni-bits. They are OK as long as you don't go 1 step too
far. Unfortunately I have done that a couple of times,

7 pin mini tube sockets mount in 5/8" holes
9 pin mini tube sockets in a 3/4" hole.
Octal sockets vary, some mount in holes as small as 1", others require
1 1/8" to 1 1/4" holes.

You CAN find drills up to 1" in diameter with 1/2 shafts for use in a drill press, but they are not cheap. I have a 1" drill that gets used rarely.

Used Greenlee socket punches up to 1.25" (or larger) can be found on ebay at reasonable prices. They can be cheaper than a new drill bit of the same size!

Holes saws which have a drill bit for a pilot hole surrounded by a saw blade bent into a circle will do a good job if the work is done on a drill press. They cut well into aluminum or wood, but will dull quickly into steel. Back the metal to be cut with a scrap block of wood and clamp the work to the drill press table. Run the drill press at a low speed (200-500 RPM) and use a little oil for lubrication. I've cut holes up to 4" diameter into panels for meters and CRT's with these.

You're probably using hole saws meant for wood if it dulls quickly in steel
sheet metal. You have to use bi-metal hole saws for drilling into steel.
They work quite well, and used properly, will last for quite a while.

Cheers,
Dave M

Hello everyone!

If I used a 300W 12V DC to 230V AC power inverter with an efficiency of 90%,
how much power would the battery need to supply to the inverter, to run a
300W mains device? 333.3W?
Is it really that simple?

JOHN

No, you forgot the Resistive losses in the DC wires from the Battery to the Inverter, and the losses in the battery itself, when supplying large currents.

Remember that 300 watts at 12 Vdc is 25 Amps... That is a lot for anything but an Industrial Battery....

Me   one who lives Off-Grid with a much larger System

I am looking for a source of a very small transformer that will supply
125 VAC on the secondary and enough 6.3 VAC with current for 1 or two
small tubes. Something on the order of a 12AX7 or 2. Small physical
size is important. I need to be able to shoehorn the whole thing
inside of a double outlet box.

Jimmie

Bell transformers are smallish - but they put out more than 6 V AC.
If you want SMALL, a high frequency drive to a few turns on a ferrite
core it the bill well.

Hey OM:
Gits' yourself a old busted VTVM the real old ones used a 6AL5 and a
12AX7 and had to have secondary isolation for the plates of the 12AX7.
I remember I picked up a VTVM for 2USD at a radio rally

Hmm, think I got one if I didn't toss it on my last clean up.

Daughter wants a preamp/tone control she can connect between her
guitar and a PA. Circuit design is no problem but fitting it all in
the box she wants it in may be a headache

Jimmie

You can probably find a suitable transformer at www.oldradioparts.com. They
have a $20.00 minimum, but they have a good selection of new and used parts
of all kinds, including transformers. Download the latest transformer list
at http://www.oldradioparts.com/2a23efl.txt and browse thru it to find a
suitable candidate. You'll probably find just about all the parts you'll
need to build the project from the web site; it's just a bit tedious to read
thru all the lists to find what you need.
I've done business with them before and find them to be reputable and easy
to deal with.

If you can't meet their minimum, you might download the Hammond transformer
catalog from and find the part number of a suitable unit, then search Mouser
(www.mouser.com), Digikey (www.digikey.com), Jameco (www.jameco.com), Allied
(www.alliedelec) and Newark (www.newark.com) web sites to buy.

Oops... I forgot to paste the URL for Hammond's power transformer page.
It's http://www.hammondmfg.com/5cpwr.htm.
You should also download their cross reference guides at
http://www.hammondmfg.com/5ccross.htm to find suitable transformers from
other manufacturers to get the best price.

Thanks guys, I found one transformer in my junk box that should work.
As a matter of fact it is part of an audio phono preamp. Think I made
need a couple more if this works out .

Check Gary/PTOP at www.oldradioparts.com  I bought several like you
describe for small projects.

Check Signal Transformer, they are sold by Digi-Key & many others. They make
some dual secondary that are very small but plenty of current for what you
are going to use it for. I used many of them in Progressive Systems for
Electronic Gaming Machines.

Not clear on the OPs application but ....
12AX7 double triode takes 12.6 volts on its heater at IIRC 0.15 amps?
BTW 12.6/0.15 =3D 84 ohms (hot).
Another approach if circuit isolation permits it, is to 'drop' voltage
for the heater re-actively by using a capacitor.
If 125v AC is available?
For example 125 minus 12 =3D 113 volts to be 'dropped'.
The reactance of a capacitor rated for 'peak' voltage of around 180 -
200 volts; RMS =3D 120v.
113/0.15 =3D 750 ohms approx. (Since it's mainly reactive no need to get
into a vector diagram!).
Since Xc =3D 1/2pi.f.C A one microfarad cap. has a reactance of about
2650 ohms.
So 2650/750 =3D 3.5 microfarad (AC capable). In practice it'd probably
work with anything from 3 to 4 mfd. A not too unusual size of AC motor
cap is 3 mfd. But cap. size consideration.
Just floating an idea. Have only tried this on experimental basis but
it worked!
And IIRC it was a 12 volt surplus WWII tube that we used. The same AC
rectified, filtered with a capacitor, provided B+ for the experiment.

Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Hi all,
This probably isn't the right place to post this, but I figure it may be the best place to find the experienced minds that may be able to help me with this litlle problem I have.

I need to source some antennas (to supply to someone I work with), and they must have the following specs:

870-900MHz
5 dB
RG58/U cable (at least 5 feet long)
RA-TNC (Male)
Magnetic mount

As for the cable and connectors, I can buy them separately I guess and assemble as required.
I have been getting PCTEL Maxrad ones that do the trick, but I'm having major supply issues (like 2 months wait time).

If anyone has an idea where I can find these things, or what else may work, I'd be very grateful for some pointers.
Thanks in advance

Mag mount, around 1 GHz with some gain?
Sounds like an active GPS antenna like those that sell around $25
on e.g. eBay

Hi,

The noise is probably coming from the transformer. Try adjusting the fixings that hold the transformer in place. If that doesn't remedy the problem then take the transformer out and give the laminations a good knock with a mallet. Hit the sides and the top and bottom of the lams evenly and your noise should go away (or be worse HI). I used to do this all the time and it worked a treat.

73
JOHN

The fuse has now blown. I replaced the fuse and it blew again. Disconnected all secondary outputs and put a new fuse in and the transformer is working.

Put a test on the input mains current and its drawing 300mA with no load.

Had the transformer running for the past 4 hours and the transformer is to hot to touch. You can smell the heat coming from it.

Could it be the transformer at fault that caused some thing else to short and blow the fuse?

==================================
Suggest you disconnect the secondary winding from the rectifier
,probably a square block with 4 connections bolted to the chassis.

with the secondary winding disconnected switch on and measure the
current in the primary winding as you did before .If still at the same
level and the transformer getting hot as before ,the transformer is
defective (check transformer output voltage;it should be more than 15 V)

If transformer remains cool and current is low (should be negligible)
and the transformer output is well above 15V ,the fault is either in the
rectifier or electrolytic capacitors.

Or fault is further 'down the line' in the pass transistors (if so ,they
are likely also hot) You can best find out by disconnecting successive
components down the line while keep checking the current in primary
winding and transformer output.

Good luck

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Barett-

Your original question was about a buzz. I think you now have a second problem now.

The buzz may be caused by "magnetostriction" in the laminated transformer core. This effect is the lengthening and shortening of the metal laminations in response to the 60 Hz magnetic field. The laminations slide across each other at a 60 Hz rate, resulting in a buzz. There may be a varnish coating on the laminations, that becomes viscous after getting hot. As others mentioned, the bolts holding the transformer together may have loosened, allowing the buzz to get worse over time. The buzz may bother you, but is probably not a problem otherwise.

When you say outputs are disconnected, do you mean you disconnected the transformer secondary wires, or that you just disconnected the IC-706? If just the IC-706, the radio may have a problem rather than the power supply. I understand the IC-706 final output transistor collectors are connected directly across the power supply and are not switched. If one happens to short, it would blow the fuse.

With he 706 disconnected from the supply I put a new fuse and it blew. I then disconnected all the secondary wires from the transformer and put a new fuse in and it didn't blow.

I put the multi meter in series with the mains wire input to the transformer and I got a reading of 300mA with all wires disconnected from the secondary side of the transformer. I left the transformer switched on for a few hours the transformer got too hot to touch and I could smell the heat from it. This is the stage I'm up to at the moment Fred.

============================
With the secondary of the transformer not connected to anything and the
transformer primary winding drawing 300 mA and at 230V that means abt 70
Watts ,it follows that the transformer must be defective ;
possible an internal shortage due to failing insulation .
Indeed 70 Watts will heat up the transformer after a while up to a
'don't touch' level.

Shorted windings -- probably in one of the secondary sections.

RF Concepts RFC2-117 linear 2M linear amp with GaAs FET receive
pre-amp. 143-149 MHz. 10 W in 170 W out. Similar to the Mirage now
advertised in QST for $330.

I'm asking $190 plus postage from Stillwater, MN.

It can be viewed at:

http://home.comcast.net/~hsknoll/site/?/photos/&PHPSESSID=29ec62ea0bf1fe4d25e318b011cf0bbf

or

http://tinyurl.com/yktwxpz

I can be reached at 651-426-4144.

Thanks

Henry

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/
```

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information

bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

So what did you change to make _these_ posts appear?

```
Of course, if you're writing the code to control a cruise missile, you
may not actually need an explicit loop exit.  The loop will be
terminated automatically at the appropriate moment.

Well....
Last week, I 'failed to get through' using the Demon, Eternal-September
and AIOE news servers. This time, E-S was successful. However, I
switched to Demon to reply to Mikea's posting, and nothing has appeared.
This one is using AIOE. If this fails, I'll try E-S again.

Oh, I get it.  You're hard-up to sell a bunch of books you can't get
rid of any other way.  And I was wondering what this all had to do
with r.r.a.h.  I guess about as much as counterfeit Rolexes.

I hear your pain... I used to have a good newsgroup server provided by
my ISP (news.gil.com.au)... however that stopped talking to me a while
ago, and I've since resorted to Google Groups, which while usable, I'd
much rather use NNTP directly.

Anyone know of a decent newsgroup server that is open-access?

Well, Eternal September (was Motzarella) and AIOE are my 'backup' news
servers. Both are free. With E-S, you simply sign up. With AIOE, you
don't even have to do that - just change the name of your news server to
'nttp.aioe.org' (at least in Demon's 'Turnpike' news client). However,
neither allow binaries so, for NGs like
alt.binaries.schematics.electronic, I have to stick to Demon's own
server.

Open access ones often become spam sources and are then blocked by other
news servers, especially those still run by ISPs. Then posts don't show

up, or only some people can see them. That can become frustrating.

After my ISP dropped Usenet (hurumph ... grumble ...) I signed up with
news.individual.de and all was well again. Ok, not free but it costs
only 10 Euros per year. It's in Germany yet they signed me up even
though I live in the US. No binaries though. This is their registration
page in English:

I haven't tried it myself (yet) but I heard that it may be possible to
pay the small usage fee for several years in advance. That would cut
down on wire fees as banks typically charge them for every single
transaction regardless how small. Not sure how PayPal would work, I
don't have that.

Way back then they didn't accept PayPal.  (I see they do now.)
I signed up through/with ClickandBuy.  T'were no hassle at all.

Hi all,

Colin Horrabin, G3SBI, has just updated information on the AOR AR7070 receiver, that is expected to be put into production soon, probably as the SW development will be completed and fully tested.

The information can be read on Martein=92s, PA3AKE, web site, in the =93Upconversion front end by G3SBI=94:

http://www.xs4all.nl/~martein/pa3ake/hmode/g3sbi_intro.html

An inside picture of the receiver and very interesting information are reported.

The AR7070 has a bandscope that will show the 25kHz bandwidth around the tune frequency, showing a blip from a 0.1uV signal and has a dynamic range of 110dB. NF is around 11/12dB and the IP3, for signals within the roofing filter bandwidth is +21dBm and + 36dBm at 10kHz spacing. All these figures were obtained without adjusting the first mixer for optimum balance.

BTW=85 the first mixer is an H-Mode Mixer !!!

As G3SBI states, the AR7070 when in production will be in a class of its own for an up-conversion radio. It is probably the first super-linear up-conversion receiver.

Too bad AOR may not associate a transmitter to such a super receiver.

Enjoy the reading and 73

Gian, I7SWX

I have an Alliance Tenna-Rotor model T-20 with control box for sale. It has about 87 feet of 4 conductor cable that goes with it. It can be viewed at:

http://home.comcast.net/~hsknoll/site/?/photos/
&PHPSESSID=29ec62ea0bf1fe4d25e318b011cf0bbf

or

http://tinyurl.com/yktwxpz

I'm asking $30 plus shipping CUS.

Thanks

Henry

I'll take it. But does CUS mean Continental US sales only?   I'm in
Puerto Rico.   I'll pay the shipping cost (USPS Parcel Post). USA zip
code 00765. email for a reply is radioexray@gmail.com.

Could be , I came by this part in '73. There is a pretty good chance
it was from a Lo band VHF unit.

You sure it's actually an oscillator?  I have some units that could be
like you describe that are just thermostat-controlled ovens for
```

crystals. The oscillator is separate, for the ones I have. Guess you
could find out more: check the resistance between each crystal-socket
pin and each of the octal base pins (and perhaps if two of the crystal
pins are in parallel, sharing a common ground or equivalent).

Cheers,
Tom

Thanks Tom. You are correct. Leads from the crystal sockets go
directly to the octal connector.

Suppose I have a DC power supply of 12V, what kind of circuit I can
construct so I can get +5V and -5V output simultaneously, with a +5V
and a -5V regulator? Hopefully no transformer is involved.

I couldn't find any topics thru google search.

+5V could be done using a buck converter, sometimes called step-down.
-5V requires what's called an inverting converter but that one needs two
inductors. Can all be done using regular catalog inductors, no need to
wind transformers.

Plenty of examples on manufacturers web site. Linear Tenchnology
Corporation, Texas Instruments, National Semiconductor, ON Semi, and so
on. But first you'd have to determine how much current you need or want
to be available on each rail.

Since this is a ham radio group be aware of the fact that switch mode
converters spew a lot of radio noise around. While you could use a
linear regulator for +5V (with potentially lots of heat dissipation) you
can't do that for -5V. So the layout has to be as good as if you were
designing RF circuitry. Full ground plane and that sort of thing.

Eh? I normally do it with a single inductor...it's exactly the same as a boost converter, just referenced to the positive supply. See, for example, MAX1846, or LM2673.

OP: If you only need a few mA or less at -5V, you might consider a switched-capacitor converter such as the LT1144. At low current, it generates nearly the same negative voltage as the positive you put in, so you could run it from your +5V supply. If you search some of the "likely suspects" that supply power regulator ICs, you'll find some that will happily do a positive output voltage and a negative output voltage, though things may get complicated enough with one of those that you'd just as soon use a couple different ICs. If the power you need out of the +5V supply is modest, consider just using a linear regulator. The power dissipated in the regulator will be 1.4 times the power dissipated in the load you're supplying with the 5V. That is, the current drops through 12-5 =3D 7V in the regulator. 100mA load current would cause 0.7W dissipation in the regulator, which would probably be easy to handle. If your load current is 10 amps, that would be 70 watts dissipation, and you're probably better off with an efficient switching regulator.

Suppliers web sites to visit: you might add Maxim to Joerg's list. (There are lots of others.)

Cheers,
Tom

Indeed. But it depends on how much current you need from the -5V supply.
For low currents, try some sort of multivibrator /squarewave generator
(NE555 - even a couple of transistors!) to produce an alternating
signal, AC couple and rectify.

Ian, its been a while since I built a charge pump but I think my
experiments showed it would do about 25ma as a voltage doubler. I was
using +5 to get -8

That was using an NE555.

Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

They probably have kept all old invoices and are looking at what
they paid for their 700 MHz wireless mike 20 years ago.
But that does not mean the cost for a replacement will be the same today.
It may well be 1/10th of that amount.

How is SSB activity in your area these days?

Over here (Netherlands) it never was as big as FM and one would not
expect to hear much in the morning hours, when many hams are at work.

But these days, even during evening hours there is not much SSB to
be heard anymore. There seems to be activity only during band openings
and contests.

Same here, I had to call someone to get him to give me some test
counts on SSB to test my lash up.

Has anyone pulled a VHF Rx to enable the Wx APT transmissions at
137.1MHz? If so, how easy is the conversion?

If not, a downconverter to enable the Wx signals to be received on a
VHF wideband broadcast receiver.

Can anyone point me in the direction any cirecuits, kits or any mixer
circuits or any other info regarding this project. Complete systems
from Timestep, ICS and Hamtronics etc are reather expensive. :-)

Best regards David 73 de G6UXD/MM

I got into this years ago and modified a Radio Shack Weather Cube
radio. I don't remember the specifics but it wasn't difficult. I think
all you need to rx the weather sats is a radio and a PC with a sound
card. Free software is available.

David-

If the FM receiver has high-side injection for the broadcast band, you may be able to pull the local oscillator a bit higher, and receive the 137 MHz signal using low-side injection. I think the receiver's RF amplifier stages would need to be retuned as well. A counter would be helpful to be sure you are receiving the right signal.

I think it would be easier to build a crystal controlled converter to translate the 137 MHz signal to the FM receiver's IF frequency.

Fred

Never tried it but I think the receiver being wide band may be a
problem. There are a few ICs out that are basically radios on a chip.
It takes very view added parts to get them working. I cant think of a
part# now but I am sure someone will.

What would be the point.... the FM radio already can convert the
137megs to 10.7 megs with just modified coils! Why complicate something
simple? A signal generator would be more useful than a freq counter to
get it on frequency. The beauty of it is it will also receive aircraft
... the FM discriminator on cheap FM radios will also happily
demodulate AM. I have done this, it works well, and takes just 30
minutes.

Summary: Recruitment announcement for ham-radio-related FAQ articles
Keywords: FAQ, Intro, amateur, ham, radio, recruit, recruitment
Xref: g2news1.google.com rec.radio.amateur.antenna:14686 rec.radio.amateur.dx:551
rec.radio.amateur.equipment:1742 rec.radio.amateur.homebrew:3108
rec.radio.amateur.misc:4602 rec.radio.amateur.policy:25203 rec.radio.info:1217

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment

Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

Are those still available? Radio Shack (in the USA) used to sell them (when they used to sell electronic components). I have a pair of them somewhere from when I was going to use them as part of my wideband 10 GHz stuff back in the late 80s. Haven't seen them for sale for quite some time....not saying they AREN'T out there, though....

That was the odd thing about Radio Shack, they'd often have these really unusual ICs that other places didn't carry, and they'd be popular in projects so long as they were stocked by Radio Shack. And once they disappeared, it became a lot more trouble to get the ICs. On the other hand, when they were cleared out one could stock up at more reasonable prices.

All of those 99cent FM radios with the tune and reset buttons use a variant of those TDA7000. It's the same concept, convert down to an IF in the tens of KHz range and use active filters for filtering, then some sort of "frequency locked loop" to extract the contents of the signal. The ones in the 99cent radios simply have circuitry added for tuning, one button starts a ramp, it stops on a signal because there is detection circuitry, and then pressing the tune button causes it to go to the next station. Pressing reset causes the ramp to start at the beginning again.

Note that the weather satellites have narrower deviation than used on the FM broadcast band. I seem to recall narrow enough for "two way radio" equipment, but the articles would generally suggest a somewhat wider filter to compensate for doppler shift.

FM broadcast receivers may be too wide to get a good demodulation from the narrow band deviation, and their LOs may not be stable enough for the narrower signal. The latter would be fixed by using a digitally synthesized receiver, but then it would no longer be a simple matter to retune it to the new frequency.

People tended to use scanners or crystal controlled receivers for the 2M band. One article in "73" pointed out that the standard bandwidth was a tad narrow, so they bypassed the 455KHz ceramic filter, leaving a wider filter at 10.7KHz.

Of course, older equipment was set up for wider deviation and that might offer up a better choice, like those Regency scanners from the early seventies.

I don't know what's in the current crop, but older cordless phones had a 10.7MHz first IF and then a 455KHz second IF, and one could extract that IF section from the phone or the base to use with a suitable converter. There one could bypass the 455KHz ceramic filter for wider selectivity, maybe put a better filter at 10.7KHz.

TV sound IFs at 4.5MHz are narrower than FM broadcast band deviation, one might use one of those behind a converter, though one now has to look to find an old enough tv to extract the circuitry in a recognizable fashion.

Older cellphones used a similar scheme, though of course their first IF was often higher, but they often had the IF as a module to easily extract. The problem with that is one rarely sees those old and clunky cellphones anymore, and the current handheld will not have suitable circuitry.

Michael VE2BVW

hi
anyone have info about a monarch tube stereo? SMX-52AC.

was monarch similar to other japanese companies such as pioneer?

thanks
louis

A fellow I work with showed me his new antenna buy for his handy-talky.
A slim Jim. The punch line is low angle radiation boosting apparent
gain.   I bought one too. Under $30 with feeder and connector.

Brian w

I need a microphone for an Icom IC-229H 2m mobile rig. I don't need a fancy mike, just one with push to talk will be fine. The mic cable should have a circular female connector with seven pins in an outside circle and one pin in the center.

I can be reached at 651-426-4144 or wa0goz@arrl.net

Thanks

Henry WA0GOZ

So you want instructions on how to make one? Get an electret capsule, one can dig them out of a variety of consumer electronics such as cheap telephones and cordless phones and 49MHz walkie talkies, likely most FRS transceivers and cellphones. You can even buy them. Then find a suitable enclosure. If it's hand held, you want a box that will fit your hand, not too large. Then find a switch that will be comfortable to operate, a lot of consumer electronics will offer up circuit board mounted switches that would be suitable if you figured out a way to mount them and activate them. Then find a cord and wire it up.

A desk microphone, you'd need to cook up some sort of gooseneck for it, but you can now even buy "computer microphones" for a few dollars that have the electret microphone and the gooseneck. Figure out a switch and wire it all up.

If you are trying to buy a microphone, there are newsgroups for that.
If you were looking for recommendations, there is at least one newsgroup for that.

I have been googling around for a heathkit outer 1" knob for a tube
transmitter (DX-100).  It is this knob:
http://www.ppinyot.com/heathkit/IMG_2788.JPG
on this transmitter:   http://www.ppinyot.com/heathkit/heathkit.htm

I appreciate any help locating one.

Thanks,
Paul P.

I came by some old 1Ghz directional couplers. They were marked "Bad".
I opened up a couple of them and they look like they would make great
project boxes for preamps, osc.... etc. Inside measures aprox 3 X 1.5
X .75 and wall thickness is .25 inches. It is about a 1 lb block of
CNC machined brass. Ive seen dozens of these or similar at hamfest
that could have been had for nearly nothing. From now on Im keeping an
eye out for them.

Henry,

If Icom no longer has the appropriate mic, I suggest you try MFJ. Their
mics are at:
http://www.mfjenterprises.com/Search.php?searchit=microphones

Thanks, but their tech support says their mikes are only for HF radios
  and they don't have any for 2M rigs.

I ve repaired a couple of mikes for the 229. If its the one with the
keypad the little electrolytic caps go bad. It been a while but I
think they were 1uf tantulum.
```

```
BTW the mic on my 729 works on my 229

The type of radio should make next to no difference to the microphone. The only thing with HF is that generally high power is used, thus there's the possibility of RF getting induced into the microphone signal. Appropriate usage of decoupling capacitors will nail that problem.

I wired up a computer headset to a few of my radios; namely a Yaesu FT-290R II (normally uses a dynamic mic), a Wouxun KG-UVD1P handheld (normally uses an electret mic) and my Nokia 3310 mobile phone (again; electret).

For the Yaesu, it uses an 8-pin "Foster" connector[1] like you describe for your Icom. On the Yaesu, the three pins of interest (for microphones):
- Pin 7: 0V
- Pin 8: Microphone signal
- Pin 2: 5V

According to [2], the pins you want are:
- Pin 1: Microphone
- Pin 7 & 8: 0V
- Pin 2: 9V (maybe)

Measure with a multimeter to check if pin 2 & 6 has 9V across it... if not... you can use a small 9V battery, or tap off your rig's power supply input.

```
Radio   :               Interface              :        Electret
Microphone
        :                ______                 :
V+------+---------------[______]--------o-------+-------o--------.
        :                 R1            |       :       |         |
        :                               |       :       |    | .-+-.
        :                               |       :       |    |/     \
        :                         C1 -------    : C2 ------- |       |
        :                            -------    :    ------- |\     /
        :                               |       :       |    | '-+-'
Mic-----+-------------------------------'       :       |         |
        :                                       :       |         |
0v------+---------------------------------------+-------o--------'
```

```
        :                                       :
```

That above circuit works well for interfacing the headset to the
FT-290R II, and I've had good audio reports using that setup. It
should work with most sets designed for dynamic microphones. That,
and maybe a ferrite sleeve in a strategic place, is likely all you'll
need.

The only issue I've had interfacing a headset to the device has been
my mobile phone -- GSM is shocking for inducing noise into everything,
including the microphone.

```

I've done this with a variety of rigs (and headsets) and it works great.
Excellent reports.

The diagram is missing the component values. They aren't critical, but I use
something on the order of R1=10K ohms and C1=0.5uF.

I don't use C2. Is it for RF immunity? I've only used this circuit on HF & while
I do run high power, my antenna is nearly 60m from the shack.

Here is a list of Simpson meters I have for sale and the prices
I'm asking as a starting point.

Model 362 Low Range Ohm Meter   0-5 and 0-25 ohms    $20

Model 390 Watt and Ampmeter   300-3000W and 3&15A     $30

Model 260 VOM with mirrored scale            $60

All items plus postage in USA only.

Photos of all can be seen at:

http://home.comcast.net/~hsknoll/site/?/photos/

click on the images to enlarge them.

I can be reached at either wa0goz@arrl.net  or 651-426-4144.  Ask for
Henry.

Think about it...

- How many trainings have you attended in the past?

- How many teleseminars have you listened to?

- How many books have you read?

...and after all those opportunities to learn, what do you have to show for it?

We've been forced to put this training together differently because...

...the old ways weren't really working!

That's why we've pulled together ten super successful real estate investors and asked them to share with you their "real stuff"...

==> http://www.TheRealEstatePlayers.com

This 10-Week Advanced Course is:

- Stretched out over ten training sessions. It will allow you to learn, and then have time to think about, analyze, and implement each tactic before the next call.

- A complete program covering many areas of investing in real estate. From finding deals to finding money to buy them we've covered all the bases.

- Setup for YOUR success - We've put together a Back Office area specifically so you can re-listen to each trainer's specific strategies.

We have setup an enviroment where you

can actually learn and implement the strategies
you hear. We want you to turn your annual income
into a monthly income!

271 FREE spots remain, grab yours now!

==> http://www.TheRealEstatePlayers.com

Hope to see you there.

P.S. Not sure if this is for you? I understand your
hesitation. But consider this: Think about all the
top investors you know for a moment.

Haven't you always wanted to know what strategies and
methods they are using to make their money in real
estate? Do you see any change in the strategies at all
from what they were doing even one short year ago?

Of course you do!

Do they know something you don't know? Or do you think
they're losing money hand over fist? You obviously
recognize the importance of a competitive advantage.

So why in the world haven't you registered yet?

Don't be one of the unfortunate few that are left behind!

I have an ok FM transmitter goes about 30 or 40 feet. I also have a
Jensen Wireless 900mhz for speakers. I read where the Jensen uses a
2.4mhz signal. Is there a part I can take off my FM transmitter so the
Jensen can tranmit on 88.9-179?

Thanks!

J

Well, component values are dependent on what you're using... but
10kOhm for R1 and anything between 10nF and 1uF is suitable for C1.
C2 is an EMI supression thing... I have gotten away without it on
radio, but I found I got *lots* of complaints when I tried to use a
headset lacking C2 on my Nokia 3310 mobile phone.  (I did have C2, but
I had it down near the plug in the phone.)  If you take apart a GSM
mobile hands-free kit, you'll see a small chip capacitor soldered on
the back of the electret capsule.

http://pinouts.ru/CellularPhones-Nokia/nokia_headset_pinout.shtml
describes the schematic, and my usage is based on this. :-)

On amateur radio, it can't hurt, and can only make your signal better
IMO... I think Heil and other companies do a similar thing for
electret microphones.

Ah. I've not tried that circuit on VHF, let alone UHF, let alone a phone, but I'm quite familiar with the mess a mobile phone can make of a microphone signal!

(I work for a TV station. Our newsreaders used to think if they turned off the ringer, they could leave their phones in their pockets while on the air. Two or three interrupted stories later, they learned to leave their phones in their office....)

What value are you using? (I would suppose something on the order of 500pF would
be adequate. I've seen people use rather large values in an attempt
to reduce HF audio response..)

I'm afraid not, you're not going to be able to pull the frequency that far.

(even if you could, there's a good chance the Jensen unit doesn't transmit a signal that's compatible with FM radios)

Yep, strangely the arrangement sans C2 was fine for 70cm doing 4W
FM... but not okay on 900MHz doing ~100mW GSM signalling. The joys of
GMSK at 9600 baud.

Hmmm, buzz buzz... "Ohh, sorry about that interruption, that was my
phone."  Ooops!

Usually some nominal value... the doc I linked to recommend a 10nF.  I
have no idea what some of them are using, but anywhere between 10nF to
100nF would be sufficient.

If you want to be truly scientific about it, you can pick a frequency
and dimension the capacitor so that Z=3D1/(j=CF=89C) is sufficiently high t=
o
not matter <10kHz and approaching 0=CE=A9 at the frequency of interest.  I
like the suck-it-and-see approach for this application however. :-)

My first homebrew antenna (and my first antenna other than the rubber ducky that came with my handheld) was a Slim-Jim J-pole. You can make them up for about $2 or so... 300=D9 television ribbon cable, some coax, and a connector. There are a few construction guides on the 'net, and I can vouch for their performance.

Hi

I have a Watson W-30am 30-35 Amp peak power supply.

After using an IC-706 running 30-40 Watts on PSK31 for a few hours the power supply starts making a very load buzz/hum on keying the radio. The noise decrease's and increases turning the power up and down on the radio itself.

I have also notice the buzz/hum is still there when the radio is disconnected and a small load say 1 Amp connected to the PSU, although the noise is a lot quieter. So I don't think that the radio causing it.

When I start it all up the next morning the power supply is running fine again, no noise until I have been keying the radio in PSK31 mode for several hours when the very load concerning buzz/hum starts again.

The power supply has a top case fan that draws the heat out of the case and the power supply case doesn't feel hot to the touch. When the load noise occurs

Does anyone have any thoughts what could be causing this?

Thanks for any advise or help in advance.

1) Is the PSU for 50Hz or could it be for the American market to operate at 60Hz   Transformers for 60Hz don't like to be fed with 50Hz AC especially when they are marginally designed. For 60Hz the laminated core can be made smaller than for the lower 50Hz frequency.

2) If the PSU is switched on WITHOUT ANY LOAD for a number of hours will it (the transformer) also start humming after some time ?

3) When humming is the transformer warm/hot ?

4) If you have a variac (auto-transformer with adjustable output) connect it to the PSU when it is humming and (without any load) reduce the AC input voltage to the PSU.   Will the humming then stop and if so at which voltage ?

5) All the above assumes the PSU is NOT of the switch mode variety.

Sorry , I missed the first line of the message . The Watson 30 am is a
traditional power transformer based PSU for the UK market , hence for 50
Hz ,no doubt.
It is still important to check the transformer temperature ,before as
well as after humming/buzzing has commenced.
Also check the electrolytic (buffer)capacitor(s) connected to the output
of the (bridge?) rectifier.

Again ,sorry for my oversight

Frank   GM0CSZ / KN6WH

I would start by tightening bolts and screws on and around the
transformer. I had a similar problem and it was a loose screw a couple
of inches away from the transformer. Keying the Tx would sometimes
cause the problem to come or go.

==

With reference to that;

"Is the PSU for 50Hz or could it be for the American market to operate
at 60Hz   Transformers for 60Hz don't like to be fed with 50Hz AC especially when they are marginally designed. For 60Hz the laminated core can be made smaller than for the lower 50Hz frequency."

Recall reading about a DXpedition to some tropical 50 cycle island many, many years ago by a US ham team.
Their transceiver had a built in US style PS. They found they had to down-rate the power output and at one point had the covers off and damp rags applied to the transformer attempting to keep it cool. That btw was before the days of 'switching' PS.

Which leads to a question:
Q: If the supply frequency is higher than original design, say 60 instead of 50, i.e. 60/50 = freq. ratio 1.2
What would be the increased power handling capability at the higher frequency?
Maybe that ratio squared? i.e. 1.44 times power handling???? Or????

Another reason for asking is that I have an old either 20 or 25 cycle/hertz TV transformer from the 1950s. It was so much bigger than the 60hz. version that it was mounted out of the metal chassis and attached to the wooden cabinet base .... ooh; me aching

back!!!!! That Trans. must be at least twice the weight (maybe
weighing it would be best policy?).

Comments appreciated. TIA

==

A 50Hz power transformer happily works on 60 Hz but not the other way
around. A 60Hz transformer is permitted to have a smaller laminated core
than a transformer for a lower frequency ,it is a matter of magnetic flux.
In the valve (tube) era aircraft had a 400Hz onboard AC system ,meaning
smaller hence lighter transformers saving weight.

That's why switch mode power supply units operating at 100kHz or perhaps
higher frequencies have relatively small (ferrite) transformers ,hence
the low weight of these units compared with laminated transformer
equipped 'linear PSUs' of the same power rating.

A number of years ago I acquired a US made Astron RS-50A 13.8v PSU
.........very heavy.
Underneath the 220V sticker label the case printed label shows 115V
BTW the primary transformer winding can clearly be connected to a US
230V-60Hz supply
When connecting the unit to the UK (nominal)230V-50Hz supply system the
house magnetic circuit breaker for that group of outlet sockets usually
trips (no 13.8 V load attached)
If no trip occurs the unit buzzes heavily ,possibly   because the
transformer is very close to the metal enclosure .

The switch-on trip problem can possibly be overcome using a 20-50 Ohms
high power resistor in series with the primary transformer winding which
is subsequently shorted by a relais contact after say 1 second .
This system limits the high inrush current caused by initial charging of
the high capacity electrolytic capacitors .

But it is clear to me that the high power transformer designed for 60Hz

is unsuitable for 50Hz and having found a suitable 50Hz transformer of
roughly the same rating ,I'll replace the US made transformer with this
for 50Hz designed unit .

Frank   GM0CSZ / KN6WH

PS : I'll happily donate the US made 60Hz transformer to anybody
collecting it from my QTH in the north of Scotland.

The power rating of any transformer is determined by the laminated core
but also by the primary and secondary windings.

So, a transformer designed for 50hz will happily work on 60Hz but does
have an increased power rating because the primary and secondary
windings do not perform differently on 50 or 60Hz.

Your 'heavy beast for 25 Hz' will imho work equally well on 50 and 60Hz
,be it that the laminated core is over-sized for those frequencies , but
the primary and secondary windings ratings will be the same at 25 ,50
or 60Hz .

Has anyone tried one of these power supplies a Watson Power-Max-45-NF and are they any good?

How loud is the fan and is it a thermally controlled fan?

I have been looking for some reviews but I haven't found any.

Thanks

```

Has anyone tried one of these power supplies a and
are they any good?

How loud is the fan and is it a thermally controlled fan?

I have been looking for some reviews but I haven't found any.

Thanks

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/
```

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire

```
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article       |
is that it does not mention newer amateur radio newsgroups created since      |
it was written, including:                                                    |

 rec.radio.amateur.antenna                                                    |
 rec.radio.amateur.boatanchors                                                |
 rec.radio.amateur.dx                                                         |
 rec.radio.amateur.equipment                                                  |
 rec.radio.amateur.homebrew                                                   |
 rec.radio.amateur.moderated                                                  |
 rec.radio.amateur.space                                                      |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions.  We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Please don't post followups on articles "because they are offtopic".
People use methods to filter those articles.  They see only your
pointless followup.

This method has proved helpful on several low-volume newsgroups.
It's important to clip the random assortment of newsgroups to the ones
YOU care about.   In error, I allowed rec.puzzles remain, and so did
you.  Pity!   As to filtering, that's helpful. People who filter can
easily filter on "non and "not" in the subject. Perhaps you could
consider that?

I have an HF amp that uses a single 811A in grounded grid. The power
```

transformer smoked. The transformer was from an old TV set I think it
was rated at 540VAC on the sec and I ran it into a voltage doubler for
about 1300 VDC . Any info on something I could use as a replacement
would be appreciated.

Jimmie

There's an ample supply of used xfmrs at PTOP oldradioparts.com

I recently got one for my homebrew xmtr. You might have to buy some
other stuff to reach the $20 minimum order. I have never failed to find
other things that I 'need'.

Andy comments:

  You might investigate using a high voltage transformer from an old
microwave oven......  If the secondary voltage turns out to be too
great,
their construction makes it fairly easy to remove some turns...

   I haven't tried this, .... just something to consider..

Ha! Jimmie is not being helpful if he does not indicate the primary
volts he expects to provide.

One clunky solution is to connect in series the outputs of two 240 volt
secondary transformers, while setting the input tap as low as it will
go.   Inputs volts, and desired output current and volts would be good
to know...

Hmmm....come to think of it - they tend to go to 1000V AC secondaries -
but there is plenty of stray magnetic circuit usually provided which
might need knocking out of the core...

============================
Another problem being the transformer laminates often welded across.

I wouldn't use a microwave oven transformer for a transmitter power supply.

Frank

================================
I might have a HV transformer for 240V-50HZ with a mid-tap for 120V.
50Hz Transformers work well on 60 Hz.....but not necessarily the other
way around because a 60Hz transformer has a smaller laminates pack

I have a US made 230V-60hz Astron 13.8V-50A PSU causing AC power trips.
I am going to change the 60Hz transformer for a similar
50Hz transformer.

Frank     GM0CSZ  / KN6WH

HEY OM:
My choice is a MOT, with zero crossing phase controlled primary with
lots of snubbers and filters. Put the MOT in a box with a fan. A zero
crossing traic opto coupler regulated by a TL431 with an inverter pass
transistor. Power the TL431 seperately and make sure your voltage
divider resistors can handle the voltage, I use 1 meg 1/4 watt. they
can handle about 200 volts a piece.  An MOT can put out up to 2400 VDC
no load depending on the type. You going to need a 25amp traic at
600prv or more. You can figure the TL431 to regulate that puppy at
1300VDC easy. And the zero crossing traic opto coupler gives you
tonnes of isolation. Been there done that.

I found a transformer that would work out in the barn but it is
freaking huge, I would never get it in the box.

I was thinking of using this transformer for the same purpose.
I assume this is the single 811A amplifier in the 1967 ARRL handbook?
If you use this transformer you can put the secondary windings in series
and use a bridge rectifier instead of the voltage doubler.  You will get
  slightly higher voltage this way (the tube won't mind).  I think this
transformer might be able to handle TWO 811A's in parallel if you want
to beef up the amp.

Yes that is the one, more or less, Back when I was in high school I
built it as a CB amplifier in my junior year 69-70, Im so ashamed. I
do have another power supply I might could use with it. Its built in a
rack mount chassis and would not be my first choice. Ive found 200W
PEP to be more than adequate but I may consider that option. I wanted
```

```
to complete the amplifier by adding the rest of the ham bands.\\

HI Folks,

After a long hiatus from HF and HF amps, (Just got back from an incredible Arecibo Moon Bounce activation; a 60dbi gain antenna on 432 is a transforming exprience)

I am helping someone build a homebrew amp,   a pair of 3-500Zs for a friend in South America. First, I wonder if anyone (Preferably living near Buenos Aires, or Montevideo, has for sale a 2 x 3-500Z amp commercial, or hombrew?   Even better, an unfinished one, or a commercial "Basket Case" in the Heathkit SB 220, L4B or Kenwood TL 922 genre. I have most of the components for such an amp, here is W6 land, and can easily ship the lighter components, to the ham who is building it. I would rather source locally, (Uruguay or Argentina, or perhaps Brazil) the heavier components, the B+ Power Supply transformer, and 30 amp 5V filament tranformer, etc, and maybe even a chassis/Front panel.

Being a resourceful guy, I would also be willing to canvas the lower power broadcast radio stations, finding engineers who are ham friendly, with spares, storage rooms of things like Plate transformers in the 2KW, 4000 volt class. I think I might be able to find those engineers, through internet searches, of Broadcast Engineers in Uruguay, or perhaps Buenos Aires.

The ham who wants to go QRO, lives in Uruguay, and the three major metropolitan areas that might source hams, parts, or surplus broadcast components, are Montevideo, Salto, and down the road a piece, Buenos Aires.

I also have been out of the loop in HF amps, specifically 3-500Z tubes. All my past experience with these has been with EIMAC tubes. Are there quality Chinese or other maker 3-500Z tubes out there? Which ones, are good value?

Also, the GS-35B used to be very cheap to reasonably priced powerful tube. Maybe from a clean sheet of paper planning for a legal limit amp, a GS 35B is a good choice for a tube, any suggestions?   I have seen relatively simple mounts for the GS 35B, basically a Clamp of the grid ring to the chassis with a hole thru chassis to connect the relatively low current Cathode/Filament supply. The Anode cooler is impressive, and probably requires substantial pressure and flow, and a teflon or similar chimney for full dissapation.

I dont have the specs or a schematic off the top of my head, but does a GS 35B plate circuit have similar values of operating impedance as 3-500Zs at legal limit, therefore requiring similar Tune, Load, and Inductance tank values?   To get legal limit from a 3-500Z pair requires higher than usual commercial design B+ voltages, perhaps 4KV. Is the GS 35B happy with 4KV on the plate, or is it happier for full legal limit/100 watts drive, with higher voltage?

So.... just a few basic questions for this OT, who has been away for a while.

BTW, several years ago, I sold a homebrew 2 x 813 Amp to a guy in the mid west, whose call and name I dont remember, but I found the schematics, and the original control wiring harness for that amp, which I had misplaced at the time of pickup. If you recognize me, or that 813 amp, get in touch, I can send you the wiring harness...
Thanks, best, 73,
Pat Barthelow AA6EG   best email is apolloeme@live.com

I am really new at electronics projects. I am trying to build a repeater out of two mobile VHF radios and I'm not sure how to solve a problem I am having:

My main problem is with the radio that I want to transmit. It does not have VOX mode on it and I'm not sure how to get the first radio to trigger the second radio to transmit. Is there a simple way to do this or do I actually need a radio with VOX capability?

Thanks in advance for any and all help I may receive!

-David.

Surf over to the Repeater Builder page at http://www.repeater-builder.com/products// They have lots of info on repeaters and some of the problems associated with converrting a mobile unit to repeater service.
Be sure to look at the technical info page at http://www.repeater-builder.com/rbtip/index.html#main-index. It has lots of links to other sites that might come in handy.

You need to build a circuit that connects the Squelch signal from your
receiving radio to the PTT input of the transmitting radio.
This could be as simple as a transistor and a resistor, it could add
some timer(s) and tone generator(s), or it could be a complicated circuit
with a microcontroller.
It all depends on how you want the repeater to behave.

Ive got a couple of Variacs less the mechanical bits. I was
considering the possibility of winding a secondary on these.

Ah, brings back memories! Permit me a few words of bandwidth.

I built our club's repeater in the 70s. WR4ARO, iirc. Don't recall
much but it was a Motorola Sensicon (A?) receiver strip and an RCA
transmitter strip. It wasn't quite as simple as tagging off the squelch
to key the xmtr, although that could work functionally. I built a COR
(Carrier Operated Relay) circuit from a 73 Magazine article.

The gist of it is that you need some 'hang-time' with a repeater to deal
with mobile drop outs, and you need to be able to sub in the callsign ID
at intervals and deal with timers and such to allow the thing to shut
off transmitting in the case of noise or a deadman on the mike.

Much easier these days since rptr circuits are more commonplace and
well-designed.

Think outside of the VOX box.

GL,
Bill

Old TV set transformer probably give 350-0-350 that could be voltage
doubled to produce say 1200 volts DC filtered and/or stepped up.down
by putting some of the other windings in series with say the primary.
For example if the 5 volt rectifier heater winding placed in series
with the 115 volt primary winding (voltage bucking) it could oppose
the input by some four per cent. Putting the 6,3 volt and the 5 volt
in series would reduce the primary input voltage by some (5 + 6.3) /
115 =3D 0.098 or roughly ten per cent ........... and so on!

Tested the voltage ratio of a 115 volt ex microwave oven transformer
and it was approximately 20 to 1.  Or about 2300 RMS out. If that were
half wave rectified with suitable filtering DC out could be say around
1100 v. DC?

That is why I wrote about timer(s) and tone generator(s). There are many
things you can add... In the 70s/80s people built very complicated
electronic circuits, but today it is normally done with a microcontroller
and software. Of course this can mean very complicated software...

Hey OM:
VOX is easy. Take the 8 ohm speaker output, with a step up line
transformer, match the speaker output to the mike input.
Take a 1N914 rectify the audio from the mike input, unfiltered, to the
high capacitance input of a power FET. Put a 50K pot across the gate
to ground so you can adjust the "hang time". Use the FET to drive the
PTT.
Squelch the the receive radio, so now you gots VOX to the
transmitter.
Soon as the receive radio unsquelches it keys the transmit.

The caveat here is: if you interfere with a co-ordinated repeater, you
going to have to work it out, you might end up on the losing end of
that, because you can't become co-ordinated by a State co-ordinating
counsel.

73 OM

All,

I'm currently considering a design for making a steampunk radio. I just
had an idea for the VFO that I want to run by those who have a far
better grasp of the abstract mathematics of harmonics than I do.

Suppose I have a DC motor running steady at 1000 RPM. Through a
X100 set of planetary gears I create a shaft spinning at 20,000 RPM,
which is pretty much the upper limit for small drills anyway. On the
shaft is a disk that is an etched circuit board with a star pattern, that is,
500 conductors etched radiating from the center to the edge of the disk.

Now I have a wiper that is laid across the edge of the disk to make or
break contact with the outside of the star pattern, with 12 Volts DC
potential on the wiper. Assuming the shaft was conductive and made
firm contact with the center of the star pattern, should I see a 10 Mhz
square wave, suitable for say a switching mixer?

Question: How bad are the phase noise and harmonics likely to be?

Thanks in advance,

The Eternal Squire

Wow, thanks everyone! That's a lot of information to go through! lol Being that I am so new to this though, I was hoping maybe someone would have a simple way to make this work and have a diagram and instructions on how to accomplish this task the easiest but most effective way. Keep in mind, I am new, so lots of detail would be great! As I learn more about electronics and circuits, I will keep a lot of this information you have given me as reference and hopefully learn a lot! Thanks again!

-David.

***

```
    20,000 rpm, so how many revs a second?
20000 rev/minute  x  1/60 minutes/second = 333 rev/second
How many spokes?
333 rev/sec x   500 spokes/rev = 167000 spokes/sec

No, you would see a 167kHz square wave, with plenty of odd harmonics:
500 kHz, 833kHz, 1170kHz etc.
>
> Question:  How bad are the phase noise and harmonics likely to be?

The harmonics speak for themselves. Mechanical rotation is hard to keep
constant.

Really bad, but the harmonics you can filter. Phase noise is going to
be way too high for anything but CW and your frequency stability won't
be anything to write home about. However, the system you describe was
built by Federal Electric in the 1920s, so it's at least practical.

I think Federal used the Poulsen arc converter, a steady arc where this thing is more closely related to the rotary arc, also used in early wireless. There were two types of rotary arcs but both operated at much lower interuption rates, typically at around 400 hz, and generated the RF energy by means of tuned tank circuits. Federal Telegraph held Poulsen patents and exploited them in series of wireless telegraph stations mostly on the West coast of the USA. The rotary arc is not to be confused with the Alexanderson alternator, a mechanical generator of low RF energy. The alternator put out fairly pure CW. The Alexanderson patents were controlled by General Electric and were one of the main reasons for the founding of RCA after WW-1, that is, to maintain wireless in the US under US control.

The Poulsen arc was widely used on board ships. The device requires an atmosphere of hydrogen for the arc and has a supply of alcohol to provide the gas by means of disociation due to the arc. That gave the radio operator a supply of drinkable alcohol which made the "sparks" popular.

Instead of mechanical contacts I would try an optical sensor but this
may not be very Steampunk. I have a friend who built a small steam
engine, for demo purposes he would run it on compressed air at 40K
RPM.

In general the ARRL HB staff designed many projects just for inclusion
in the handbook.  QST articles were sometimes reprinted in the handbook
as well.  One example I can think of off the bat was in the '67 handbook
there was a receiver called the HB-67 which was a design made for the
handbook.  This was an 80-10 receiver using crystal controlled
converters feeding an 80 meter receiver.  The design was VERY similar to
that of a the HA350 receiver then being sold by Lafayette Radio.
   On the other hand there was a CW transmitter and amplifier featured
```

in QST that was re-printed in the HB for a few years. That was a two part article about the 'T9er' and 'S9er'. The transmitter ended in a pair of 6146B's and the amplifier used a single 3-500Z to run the legal limit. The amp would also run as a half gallon on SSB.

Gents

many thanks for the helpful messages. I have now received a copy of the
circuit/article from the 1950 ARRL handbook courtesy of a W6 station and
that has filled the gap for me.
Its a real pleasure to meet with such helpful assistance from the ham radio
community.

I was wanting to listen to VHF/UHF SSB. All of my present UHF/VHF radios are FM. I was thinking of rigging up a simple downconverter using a mini circuit mixer and my HP signal generator as the local oscilator that I can connect in front of my HF rig. I have an antenna mounted pre- amp that I think should suffice for my front end. Any foreseeable problems short of keying my transmitter while it is connected.

For best performance these mixers require a constant impedance at all three ports (usually 50 ohms). The preamp will provide this for the RF input and the output of your HP signal generator should have a 50 ohm selectable output. You may need to add an attenuator between the generator and the mixer if the HP does not provide a 50 ohm termination using a variable output. You will need to set the oscillator injection level to the mixers required 7dbm drive level for best conversion "gain". The output should go through a bandpass filter covering the IF frequency you are down converting to and provide a 50 ohm impedance. A duplexer network here is a good idea (provides a 50 ohm termination at the IF frequency and a low impedance (short) to ground to out of IF signals).

Here's one good to about 600 MHz. Been used a gazillion times in just
about all VHF/UHF transverters at one time or another. If casual
listening is all you need, hook it up just like you said...VHF/UHF
antenna to the RF port, HP signal generator to LO port (set to +7 dBm
output for this mixer and frequency appropriate for your IF frequency
such as 116 MHz for 144 MHz to be 28 MHz out of the mixer) and connect
the mixer IF pin to your HF radio antenna port. Probably a good idea to
use capacitor coupling at each mixer port, something like 1000pF should
work.

Just as an experiment, I once used the mixer & LO in one of my FM rigs. Just tapped the output of the mixer just before the IF filter, ran it through a DC-blocking capacitor out to the antenna input of a general-coverage HF receiver. Tuned the HF rig to 10.7MHz - sure enough, there were the 2m SSB (and CW) signals. Worked pretty well.

It was pretty cumbersome to tune though. Luckily, almost everyone around here is within 5KHz of 144.200...

Didn't take long to get the urge to transmit, at which point I wimped out & bought a multimode rig...

"Lucky" depends on how many locals there are ;)  If you have 10 or 20
local weak signal VHFers, it could get a bit messy ;)

For what it's worth, that's the same mixer used in the Elecraft K2
receiver section.

Thanks all , I found some little boxes in my scrap pile withe 3 SMA
connectors on each one. Plan is to get a couple or 3 of the mixers and
mount them in the boxes. Having a mixer in a box may be fun to play
with.

Jimmie

Thats a thought, I might do that with an old mobile unit I have in the
junk box. I think it will rx but the tx is dead. See if I can pick the
signal off right after the first mixer.

Performance won't be optimal, and you'll get some LO leakage.

You may want to consider trapping the LO back toward the antenna, or
using a preamp just to block the radiation.

Or just lash the dang thing together and see how it works.

Direct from Mini Circuits
http://www.minicircuits.com/cgi-bin/modelsearch?model=TUF-1%2B&search_type=model
or Downeast Microwave in the "components" section
http://www.downeastmicrowave.com/cat-frame.htm

Minicircuits is $7.50 each, Downeast is $18 each.  I assume both will
have a shipping charge.

Around here, it was in fact lucky.....

(managed an entire 15 QSOs in this weekend's contest, as a rover operation.
(admittedly only two grids...))

Yes, the bands were kinda flat.  Plus, we had RAIN on Saturday and wet
snow on Sunday here in WI (which REALLY sucks)...Sunday brought high SWR
on the 6M antenna so I couldn't use it and didn't hear a peep on 2M.
And with the crummy precip, I had no desire to rove or set up the
portable antennas on 222, 432, 902 or 10 GHz....

I'm having trouble finding the pinouts for the KV1236G. It's two varicap
diodes in one package. Can anyone help please? I've looked on the web but
not very useful.
If I connect the two diodes in parallel do I get exactly twice the
capacitance variance of a single diode and is there anything to watch for by
doing this? Also series connection of course.
Thanks. Howard.

I gather it's an obsolete Toko part. How many pins does it have? You

should be able to tell with an ohmmeter which pins the diodes are
connected to. Many duals are common cathode; some are common anode,
and a very few are series-connected.

All the duals I know of are two of the same capacitance diode, so yes,
if you hook the two in parallel, it should double the capacitance. If
you connect two in series you need some way to guarantee equal DC
voltage across the two if you want them to be equal capacitance.
Normally for that, I'd just use a single diode rated at lower
capacitance. Two (or more) in parallel can be helpful if you're
trying to reach very high capacitance (e.g. to tune an LF loop
remotely).

Cheers,
Tom

Based on the OP. Postulating some numbers!

The Long Wave band 166 to 285. That's ratio of 1:1.7
The local oscillator with an IF of 465 would be (465 + 166 =3D 631) to
(465 + 285 =3D 750) a ratio of only 1:1.18!

The Medium Wave band 666 to 1500. A ratio of 1:2.25
The local oscillator being (465 + 666 =3D 1131) to (465 + 1500 =3D 1965) a
ratio of 1:1.73.

To tune 200 to 400 khz. is a ratio of (at least) 1:2. And retaining
an IF of 465 would require, say, a local oscillator variation from
(465 + 200 =3D 665) to (465 + 400 =3D 865) a ratio of 865/665 or 1:1.3

However those 200 to 400 kilohertz aircraft beacon radios, covering
specifically 200 to 400 are quite often on eBay!

Another alternative would be a 190 to 550 kilo hertz ARC-5/BC453
'Command radio'. Those have 12 volt tubes that can easily be rewired
from 24 to 12 volt operation.

Another quicker alternative would be some form of small solid state
converter tuned or fixed into the Med. Wave band.

Let's do a "what-if".

You liive in Haiti and the earthquake occurs.

All hell breaks out...you escape with your life and nothing else.

You need to communicate with your family in the States.

What do you build for a radio from the rubble?

Looking forward to the submissions.

TMT

Hi,

A small update. I bought the MC145106, gave it to my friend and he is chuffed to bits.

Thanks again,

73

That's easy.... you go to the National Army HQ. and steal one of their
HF Rigs, then steal a battery out of a smashed Car, and strip some wire
out of a fallen building, and your on the air.... Duh....

Two batteries; most military stuff these days is 24V.

Probably like many of you I just received the following message from FCC
:

Under a new FCC rule, anyone who uses a wireless microphone that operates in the 700 MHz Band must stop operating their wireless microphone no later than June 12, 2010. All users of 700 MHz Band wireless microphones (and similar devices) - including theaters, churches, schools, conference centers, theme parks, and musicians -- will need to retune (where possible) or replace their wireless microphone equipment with other microphone devices no later than June 12, 2010. This action helps complete an important component of the DTV Transition by clearing the 700 MHz band to enable the rollout of communications services for public safety and the deployment of next generation 4G wireless devices for consumers.

For further information, please visit the website at
www.fcc.gov/cgb/wirelessmicrophones

My question : Can these wireless devices be re-tuned ,or have they now
become obsolete. The 700 MHz band is from 698 -806 MHz.

For many organisations like churches this might become an expensive ruling.

Frank   GM0CSZ / KN6WH

Frank

Thanks for this post.  I have care of ca. a dozen wireless
microphones.  Fortunately they are in two bands at ca. 500MHz.

My guess is that it will be difficult to retune these devices to
another band, and it will have to be looked at on a case by case
basis.  The Shure programmable units offer many channels in a
relatively small bandwidth.  This presumably makes front-end
filtering, and PA matching easier.

This has been in the works for some time. A number of mic
manufacturers are offering trade-in and trade-up programs for folks
with mics in the 700 MHz band.

On the flip side of this ruling, the FCC has admitted that requiring
licenses for wireless mics (on other bands) is futile at best and for
the time being at least, is throwing up their collective hands.

The NPRM is FCC-10-16A1.pdf, available at:

http://hraunfoss.fcc.gov/edocs_public/attachmatch/FCC-10-16A1.pdf

The FCC is seeking comments on the nature of licenses, license
requirements, and the whole enchilada going forward -- so more changes
are in store in the future for wireless mics.

But for now, other than clearing the 700 MHz band, churches, schools,
theatres, and bands are safe using their wireless kit.

A good site to watch on these matters is:

http://www.commlawblog.com/

it's published by a law firm that does FCC stuff. I'm not associated
with it; I find it useful.

Some can, some can't -- I'm not sure anyone could really say the percentage that are truly obsolete vs. re-tunable, as part of the original problem is that few of these wireless mics were ever registered. The FCC has a list of the *models* they know about here:
http://www.fcc.gov/cgb/wirelessmicrophones/manufacturers.html

> For many organisations like churches this might become an expensive ruling.

You can actually find some very nice systems these days for a few hundreds dollars, although I realize that for some churchs even that could be expensive. If the FCC is smart, they'll provide plenty of time (many months) between sending out notices to those who've been detected as violating the new rules and actually prosecuting... since it doesn't look good at all to go after, e.g., some small church that has been using some wireless mics for years without problems and very likely never knew they weren't authorized to do so... but now suddently they're the bad guys because Verizon or whoever paid hundreds of millions to the feds to own that chunk of spectrum and they darned well expect to be able to do so without squatters.

There are many web sites that make some mention of this issue... here's one specific to churches:
http://arstechnica.com/tech-policy/news/2010/01/time-for-churches-to-come-to-jesus-on-wireless-mic-legality.ars

OK, I just gotta ask. (I sort of collect English idiomatic expressions.) I looked up chuffed on Dictionary.com and it says: "Adjective British Informal: annoyed; displeased; disgruntled." It is also listed as describing the sound of a train, etc.
My obvious question is, if he wanted one, and you bought and gave him one, why is he "chuffed to bits"?
Or is there some more recent/other definition I don't know about?

EMWTK/IMWTK :) (Another English/English translation issue I think of enquiring vs. inquiring.)
Thanks,
Charlie Carothers

The OED has a good definition of "chuffed, a.":

"a. Pleased, satisfied.   b. Displeased, disgruntled."

"chuffed to bits" is a stock phrase that always has the first meaning,
though ("delighted", pretty much).

You are being selective in quoting the definition of "chuffed" from Dictionary.com.

The first is:
adjective British Informal. delighted; pleased; satisfied.
Origin:
1855–60; see chuff 2 , -ed 2

This is current, in common, informal parlance, as in "chuffed to bits" (="pleased to bits") and "chuffed to death"(!). This is the meaning in the posting above.

The second is:

-adjective British Informal. annoyed; displeased; disgruntled.
Origin:
1825–35; cf. dial. (mainly S England) chuff, choff ill-tempered,
surly, prob. to be identified with chuff 1

Surprisingly, this appears to be the exact opposite of the first. It's
not a meaning which I recognise, and certainly not current.

The third is the obviously onomatopoeic sound of the noise made by a
steam engine.
-noun 1. a sound of or like the exhaust of a steam engine.
-verb (used without object) 2. to emit or proceed with chuffs: The
train chuffed along.
Origin:
1910–15; imit.Dictionary.com Unabridged

HEY OM:

As incident commander you must:
Set up a command post then:
Find a few AM radios in da ruble. You will need 3 radios. One for receive, one for bfo, one to use the local oscillator for the xmitter. Using the so called morse code to send and receive your info.

The bfo radio will have to be tuned 455khz above the receive freq. so you will be able to copy morse code and will have to be close to the receive radio to hetrodyne the morse code signal. Although in pinch you could ask that A3 mode be sent where you don't needs a bfo.

For an aerial use a fallen power main, as it will be quite sum time b4 the main becomes live.
And you must has a good ground connection. Like a copper water pipe coming out of the ground, even a lead pipe would work

Send SOS until somebody copies you.

When your batteries go dead use a car altenator attached to bike frame, use nylon panty hose for a drive belt, attached to the rear rim, enlist people to peddle the bike for more power.

After it's all said and done:
File an incident report
and debrief yourself in a debriefing meeting.

I read sum where's that any frequency and any power can be used in this emergency.

HEY OM:

BTW: You might want to take a few online FEMA coarses, like IS200,
IS700 and IS800, these will give you a better idea: what really will
```

be going on, even in a third world country like Haiti.

What all of us would like: to see you get a amateur radio license and join ares, races and become part of your county emergency management, known as EOC. I know that's what any forthright ditto head should do.

73 OM,

de n8zu

UPS delivered the mixer yesterday evening but I didnt get to play with it until this AM.Im working evenings. I spent about an hour getting it connected up. There may not have been any SSB activity but I was able to hear all the usual local 2m repeaters using my HF rig set up for 10M FM.

Setup was as about as simple as it gets. With pre- amp at the antenna, antenna , receiver and osc was just connected directly to the mixer with some small coax alledged to be 50 ohms. At this thime I really cant evaluate it more than that.

Jimmie

The bands always go dead right when you finish a radio.

Keep us posted.

Good grief! My bad, I missed that one completely. I thought I was just
(intentionally) selectively omitting the definitions having to do with
steam engines and trains. :) In any case, thanks for the clarification,
that makes a lot more sense. I'll add those as the 1st definition to
the "unusual words" document that I keep.

Wireless mic's cost less for us because it takes fewer and requires
zero installation resources. Wireless speakers are on the want list
and wireless mixing board is on the dreaming list.

Modern technology costs less in the long run and most churches have
tight budgets!

Seems to be overloading a little on strong signals. This is probably
the reason rreal receivers arent quite so simple.

Here is a list of gear I have for sale and the prices
I'm asking as a starting point.

Photos of all can be seen at:

http://home.comcast.net/~hsknoll/site/?/photos/

click on the images to enlarge them.

I can be reached at either wa0goz@arrl.net  or 651-426-4144.  Ask for
Henry.

I'm astonished at the tsunami of answers this arose!.
- Tim: yes: detector + error amplifier (minimum gain, even a single NPN) + FET bias shifting.
- Bill: I love old ARRL publications, 80's QSTs are my favorites, but 3:1 (continuous) coverage is not common on ham bands. I am looking to build, and design (oh, well, guesstimate).
- Artie and Barry: I knew the heterodyne way of getting broad coverage thanks to the old Wavetek 2000 Sweep/Signal Generator. This is also used in tracking generators for spectrum analyzers. But keeping unwanted mixing products low is an art. Maybe later.
But, the first answer from Tim made me think: what's the difference in amplitude stabilizing methods on a Wien bridge and my Hartley?. In a RC oscillator you control amplitude thru some voltage dependent resistance (a lamp, a FET channel, etc.). But in my oscillator I vary it thru gate bias, which varies the average transconductance of a device working in a (nonlinear) class C. So, I Spice'd a FET damping the coil (source) tap with its Rds being controlled by oscillations amplitude, an voil=E0!, I got ~1Vp-p at the gate (and the varicaps), the gate's 1N4148 almost does not conduct. I will try a more decent of controlling the feedback (without ruining Q) and let you know.

The old school method - for a wien bridge for example - was to place a small filament bulb in the feedback path. This had a non linear response to amplitude - and a low natural bandwidth.   It's that slow response that you have been lacking, apparently.   Putting together an op amp with variable amplitude output that is smoothed on a five+ second time constant is what you need.

No big deal. Use two high freqeuncy oscillators (one fixed, one tunable), say around 2 GHz. When you mix them, the difference freqeuncy gives you the low freqeuncy you want, and the sum freqeuncy will be around 4 GHz & easily filtered out. The higher order terms that might be an issue will be things like three times one minus twice the other. A little care with your frequency plan & a good mixer & you should be fine.

There is a free DOS executable mixer spur calculator buried in with the MARTHA/LLAMA APL CAD software: http://www.marthallama.org/
The program is MIXSPUR.EXE, and is included in the LLAMA distribution. It is documented in the LLAMA manual. No APL is required.

If folks are interested, I could put together standalone documentation on MIXSPUR & park it and the executable on my personal website.

Hey OM:

Maybe you should looky at an old NTSC tv tuner. The brothers at RCA, made sum tuners for the cable tv bands that went from 5Mhz all the way up to 900Mhz

And they did it with quad matched varicaps, dual gate FET's, and a PLL.

Not only did they control the VCO, but the TRF front end also.

Me thinks your OSC is way to efficient and your Q is way to high. Roll the Q down with the right LC ratio or swamp it with sum resistance.

If you series varicaps you would increase the the amount of RF voltage they could handle before starting to rectifry the RF.

73 OM
de n8zu

Hi Guys,

Ages ago I saw a very simple circuit - a CT transformer, couple of
caps, 4 rectifiers and a change over switch.

With the switch in one position, the circuit was a bridge rectifier,
in the other, a voltage doubler.

Pointers please, I have forgotten where I saw this...

Thanks,

Mark

Just draw a standard bridge rectifier circuit, bridge across the full transformer secondary, filter capacitor at the bridge output. Now-- break the connection from the capacitor (-) to the bridge, and put in a SPDT switch, wiper to the cap (and to ground, if you will) and the two possible connections to either the bridge negative output, or to the transformer secondary center tap. There's no problem connecting to the transformer center tap with the bridge (-) floating. You can also use this basic circuit to supply two voltages at once: connect up a bridge circuit, and ground the bridge/cap (-), and also put a cap from transformer CT to ground. The bridge output (peak) will be nominally 1.4* the RMS transformer full secondary (minus a couple diode drops), and the CT output will be half that. Or, you can ground the CT and have + and - nominally equal voltages, assuming the loads on both sides are similar.

Cheers,
Tom

This is a circuit that does not suffer from temporary abcense of power
during switching. And it is using a transformer with a single
secundary winding.

Hi Joop,

Interesting circuit.

Where does the R1/D1/Q/.Q2 reference point connect to ?

I assume the parasitic diodes in Q1/Q2 form a current path ?

-Mark

...

The idea is that by using two MOSFETs in (anti)series like that, the parasitic diodes can't conduct through from q1.drain to q2.drain. However, they (the parasitic diodes) insure that q1.source=3Dq2.source is at most a diode drop higher than the lower of q1.drain and q2.drain. Then if the photocoupler is "on", the gates are pulled up toward close to the most positive voltage in the circuit, limited of course by the zener diode to protect against gate-source breakdown. In that state, both Q1 and Q2 are hard on. They are happy to conduct as "on" FETs in either direction. If the photocoupler is "off," the gate-source potential drops to essentially zero, and both FETs are off, leaving only the back-to-back parasitic diodes.

Essentially the same circuit is used in certain optically coupled relays, such as the Panasonic "PhotoMOS" relays, and in other places.

Although the "on" resistance is twice as high as a single MOSFET of
the same type, the circuit blocks both polarities when "off," and
conducts either direction when "on."

Cheers,
Tom

But should note that it puts out twice the voltage from the same transformer as compared with the bridge/CT circuit. On the other hand, both voltages use the whole secondary, so the safe available output power is nominally the same for either voltage, whereas the output power in the full-wave CT circuit is somewhat less than in the bridge configuration (assuming negligible loss in the diodes).

Cheers,
Tom

Raypsi:
- Thank you for the hint, the CATV tuners cover 54 to 900 MHz (5 to ~40 is for the upstream), an impressive 16:1 range, but the L.O. is

much narrower in relative values. Suppose 1st IF at 1200MHz, the L.O.
would sweep 1254 to 2100, 1.67:1, not enough for me.
- "The TRF front end also". Are you sure?. I dismantled a Jerrold and
the incoming CATV hit directly the balanced modulator thru a fixed
high-pass. But even if it really tuned 54-900, it would be easier than
my needs because the CATV amplitude is much lower than in an
oscillator.
- "Roll the Q down"?. It wouldn't help, I just need to vary 9:1 the LC
product.
- "Series varicaps"?. Sorry... they are back-to-back in series
already!.
Doug:
Thank you for encouraging me about the heterodyne way, and the links.
Yes, I think I will go this way for my gen-purp lab generator, but for
the dipper I still need the coil to oscillate right at the measured
frequency.
Brian:
I'm afraid this is more complicated than choosing a long time
constant, I have already tried in the simulation. The problem seems to
stem from the fact that the effective FET gm is dependent not only on
applied bias but also on RF amplitude. The error amplifier senses the
amplitude is high, applies more -Vgs, gm decreases, amplitude
decreases, but this lower amplitude makes effective gm to fall even
more, and as a result oscillation ceases and then starts again, and
again, and again. I think I will have to prevent the FET from working
in class C and forget about Vgs as a control means.
Again, many thanks to all of you. As soon as I can come back to this
subject I will let you know the results.

The idea behind www.gigawatts.nl/co/projects/voeding/dubbel/switch.jpg
is the same as the PC PSUs: you close a connection and it works on
115Vac, you open it and plug the PSU into 230V.

And if you go as in www.idesignz.org/misc/Simple%20dual%20voltage%20PSU.pdf
you're right that the full-wave center-tap mode does not make full use
of the transformer copper (by the way, just adding an electrolytic on
the center-tap in place of the switch you can have the two output
voltages simultaneously). It's unavoidable, unless wou have two
independent secondaries, of course: put both in series or both in
parallel.

But if you are looking for having two different output voltages (not
same DC voltage with 115 or 230 mains), and want to make the best use
of your electrolytics (specially if they are big ones), you should
need a means to put them in parallel for the low setting, and series
for the high. I did it with a DPDT non-shortcircuiting switch. No
center-tap (becomes a full-wave doubler as in the gigawatts link). If
you are interested I will gladly send it to your address, but you can
help me and the Group if you can suggest a convenient way to post
files somewhere (not a volatile place such as rapidshare).

I understood the suggestion was to place two varicaps in series
NOT back to back in order to extend the voltage range.
But that implies two series strings, in order to maintain the
capacitance range over a longer voltage swing??

Hey OM:

Well the dual gate FET's RCA was using were sub 1Ghz range so not only
were they controlling the bias, also they controled the miller effect
with an isolated supply for the second gate.

I should has ment 50Mhz to 900Mhz it was the splitters we used were
rated 5Mhz to 900Mhz.

So 8 varicaps in back to back series would be to much? Giving you
double the voltage and the same C.
You may be right 54Vdc would be way too much to have floating around
to tune them.
I remember the ones RCA used were so small if you dropped one on the
floor you would never ever find it.

They diode switched in 2 sets of coils in both the OSC and TRF, to get
LO VHF, HI VHF, and UHF.
So like they had 3 coils in series, all 3 for the LO, 2 for the HI,
and 1 for the UHF

Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/
d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

I think maybe you're looking at the wrong generation of CATV tuners. I think Raypsi's suggestion was for the little tin-can tuners common in say 80's and 90's VCR's, these certainly did NOT have a 1200MHz IF, closer to 45MHz.

Tim.

Look at the Elecraft K2's VCO. A single VCO covers all the HF bands
(some with up and others with downconversion), with many narrow ranges
all cleverly switched using small relays to move the varactors/fixed
capacitors in and out. I can't promise that this is exactly what you
want but there's much to be learned by studying it if you want to
build wide-range VCO's with commodity parts.

The Elecraft K2 VCO also uses a clever scheme to do AGC such that the
VCO output remains constant through its wide range, this probably also
keeps the RF voltage across the varicap in check.

There's a lot of cleverness in the K2. Schematics are online, www.elecraft.=

In the 1980s and 90s, I was intimately involved in many types of CATV set-top boxes from one manufacturer. I would have thought that, even after 10 years, I would remember to the nearest Hz what the oscillator and IF frequencies were - but I'm afraid I can't!

However, the general plan was essentially that entire input spectrum was bandpass filtered (via a cascaded highpass and lowpass filter), and presented to a 4-diode ring double-balanced mixer. I'm pretty certain that one model (50 to 550MHz) had a first IF at around 650MHz, with the LO running from 700 to 1200MHz. This was then down-converted to a second IF - the usual 45.75MHz (for NTSC).

It was fairly obvious that you could make a wide-range variable oscillator (say 0 to 500MHz) by 'reversing things', using a variable oscillator (a readily achievable 650MHz to 1150MHz), and mixing it with a fixed oscillator on 650MHz. The output of the double balanced mixer is taken from the IF port, which (of course) goes down to DC, and is lowpass filtered to 500MHz. As has been stated, this is essentially the principle used by many sweep oscillators.

For most 'amateur' purposes, there is no need to have any ALC applied to the output signal. This is achieved by ensuring that the level of the variable oscillator is relatively high (say 66dBmV or 2V), and that of the fixed oscillator is relatively low (say 0.3V or 50dBmV). A normal feature of a ring mixer is that the 'signal' loss through the mixer (typically 6dB) is more-or-less independent of level of the local oscillator - provided it is high enough. This means that, even if the level of the variable oscillator varies by a few dB across its tuning range (which it is bound to do), the mixer output level stays fairly constant 44dBmV or around 0.15V) over the entire frequency range.

But things are not perfect. Unfortunately, in the mixer, you inevitably get mixing of the harmonics of two oscillators. The effect is to produce unexpected signals within the wanted band 0 to 500MHz (and greatly dependant on the actual frequency of the variable oscillator). I know of one commercial sweep oscillator which had, at the LF end of the band, several unwanted mixer products only 25dB down. But it was still quite usable for most lab purposes, provided you knew of its limitations. The cure for this inherent problem is to have the frequencies of both the fixed and variable oscillators as high as possible (not as stated above), but this obviously makes amateur construction more difficult.

Once you have made a satisfactory wide range oscillator, it is very easy to convert it to a sweep generator by driving the varicap of the variable oscillator from a sawtooth.

All I know about the little tin-can tuners made by the billions in the 80's and 90's, is that antenna comes in one end, circa 45MHz IF came out the other end :-). Maybe the ones I saw were not the DC-to-daylight ones used for CATV. The generation I'm most familiar with took a tuning voltage that went up to 30V or 40VDC for the varactors, maybe that high voltage gave them a wider range with simpler circuitry. Of course the line-operated ones had that high voltage around for easy use in the chassis.

> For most 'amateur' purposes, there is no need to have any ALC applied to
> the output signal.

Look at the Elecraft K2's LO system. It uses a single VCO to cover all bands, and one relevant factor that lets them use the same oscillator for all bands is the ALC. It's a very very clever design, one that minimizes not only parts count but the low parts count also means low power consumption (less than 200mA for the whole rig in receive.)

Contrast that with, say, modern Japanese HF transceivers which draw ten times as much power in receive and have these ginormously complicated multi-loop synthesizers that in the end have worse phase noise than the K2's simple scheme.

My gut feeling is that the Japanese rig philosophy of making sure their receivers do DC to daylight drives up their parts count enormously with no benefit (perhaps a negative effect) on ham band performance. Maybe that's what the Japanese hams want. Heck, it's probably what most US hams think they want, if for no other reason than because the YaeKenCom ads have been pushing it as a feature (not a bug) for decades, at least as long as they've been doing upconversion ham receivers.

Of course the K2 does so well in comparison because it applies the ham-band performance simplicity philosophy not just to the LO chain but throughout.

I am looking for issues of Communications Quarterly Magazine for the
years 1992 and 1993 (4 issues each year).

Does anyone have them in either hard copy or .pdf file?

Thanks

Harv

How about free?
Go to any grocery store and buy something you want to eat in a can that
has the press on lid. Small ones about the size of Sardine cans make for
small and sensitive projects, and you can put these into an even bigger
can for a project. R.F. feed-throughs are not that expensive.
You could make a modular project you could upgrade when you wanted.
Cheers,

Bill Baka

I kind of miss all the old BUD boxes.

================================================
With PCB scrap readily available you can make any (modest) size box with
this material . I have stocked up at a fleamarket ,for life.

The problem is that the sodium intake with each can of anchovies is
humongous. But they are delicious on pizza or on a cheese sandwich.
Takes a while to get the smell out of a can tho :-)

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

 rec.radio.amateur.antenna |

```
 rec.radio.amateur.boatanchors                                                |
 rec.radio.amateur.dx                                                         |
 rec.radio.amateur.equipment                                                  |
 rec.radio.amateur.homebrew                                                   |
 rec.radio.amateur.moderated                                                  |
 rec.radio.amateur.space                                                      |
```

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

I find very low volume (as in production) instruments at flea markets
make good cases, especially if they have things like 10 turn pots on
the outside. I have two or three WTF boxes waiting for suitable
projects. Often it's just to house an open frame power supply. I often
replace the switchers with linears if the switcher is too noisy.

The nice thing about using some scrap instrument case is it generally
has the IEC connector installed, sparing the need to punch a funny
shaped hole. Just leave the controls on the front panel, which is

better than having a box with holes in it.

================================
If I use an equipment box with a number of unused front panel holes I
cover the whole front panel with PCB ,only drilling the holes needed.
Since the copper surface over time would corrode I varnish the area
after completing the project.

I've used laminate intended for kitchen countertops. I buy it at my local DIY home center. Dremel make a "laminate cutter" bit for their moto-tools. You can glue it on or just use front panel components to hold it on...

It comes in an almost unlimited set of patterns such as wood grain, marble, solid color, etc.

I'm trying to get a 500R impedance dynamic mic working with an old
IC-730. The rig does not have a built in preamp so you have to have
one in the mic casing.
I've found a suitable design by G3SEK (http://www.ifwtech.co.uk/g3sek/
in-prac/best-of.htm#icom) but it seems to be designed for Heil HC4 or
HC5 inserts. These seem to be 1000 ohm impedance. Am I going to cause
problems by using a 500 ohm mic with a preamp designed for 1000 ohms?
Can the deisgn of the preamp be modified for 500?

Cheers
Tom 2E0WNT

The 1,000 ohm input impedance shouldn't cause any problems at all;
many microphone preamplifiers have input Zs higher than the nominal
figure for the microphones with which they're used.

With all good wishes,

Kevin, WB4AIO.

No need - that design will be fine as it stands.

The 'ideal' mic preamp would have an infinite input impedance, so you
should be fine from that standpoint. If the voltage levels are
significantly different you'll have a problem -- but for that you just
need to try it and find out.

Hi all,
```

I'm converting an old 6m transverter for a friend to work on the 4m band. You can see the schematic at the following URL:

http://www.radioamateur.eu/schemi/ACC_transverter/ElectronicSystem_Transv50MHz_sch.pdf

This schematic shows in my opinion a general poor project, but I think I can make it behave in a satisfactory manner.

As you can see from the schematic, there're no component values, so I had to "reverse engineer" almost all parts. Fortunately I have some test equipment so I could redo filters and such pretty easily.

My biggest concern so far is the LO oscillator.
First of all, I found a 22 MHz TTL "can oscillator" in place of the single BJT oscillator. Even if this oscillator appeared to do its job, I can't play the same "game" because 42 MHz oscillators are very hard to find as it's not a standard value.
No, I can't change the IF frequency (28 MHz) as the owner has a dedicated equipment for this band.

Now, would a single BJT oscillator put enough LO power for the single diode mixer? There's hardly enough room to fit a second tuned stage, otherwise I'd have already done this.
The current diode mixer is made with two "ferrite bead" hand wound transformers and 4 x 1N4148 diodes. I'd substitute them with 1N5711, but I'm not sure it would help at this stage.
Does anyone have experience with a similar design?
Any hint is really welcome!
I wouldn't want to experiment too much and risk to damage the PCB (a few substitutions are ok, but if the maker used a pre-made oscillator maybe the design in the schematic was not very usefull).

Best regards
Frank IZ8DWF

If a TTL "Can" oscillator would work, then you could use a TTL or CMOS quad gate wired up as an oscillator with a 42 MHZ 'rock' and use that. There are schematics on the web for building the equivalent of a can

```
oscillator using a 74x00 quad gate, some resistors, caps, and a crystal.
If you need a buffer amp between the oscillator and the mixer, here is
an idea: http://www.kitsandparts.com/rfamp1.1.php

I think that 74xx00 oscillators are difficult to make with 3rd overtone

xtals (like the 42 MHz one available), I might be wrong and probably
I'll have a try.

> If you need a buffer amp between the oscillator and the mixer, here is
> an idea: http://www.kitsandparts.com/rfamp1.1.php

if I had space, I'd put a similar buffer after a well proven good xtal
oscillator. I have many successful designs handy, but not much space
inside this transverter :/

Best regards
Frank IZ8DWF

Hi Frank...

Wow, the mixer in that circuit looks really weird. No, make it: that mixer looks WRONG. I would not expect single diodes to be directly across transformer windings like that.

I'd expect you can get plenty of power out of a single transistor (3rd-overtone) oscillator to drive a double-balanced mixer with Schottky diodes, certainly. +7dBm is normal for that. That's only half a volt into 50 ohms, or 1V rms into 200 ohms. I'd probably pull a Minicircuits mixer out of my junque box, and not try to build one from diodes and transformers; a Minicircuits ADE-1 (or any of several others) in a package less than 6x8mm should do the job fine. Also small: active mixers. I've been playing with a Linear Technology LT5560, which works fine with 0dBm LO power.

Cheers,
Tom

I believe they made the schematic wrong!! I checked the actual circuit
and seems just right :-)
After all it was working on the 6m band.
Though they did really many mistakes that I tried to correct.
Q6 is a transistor with Ft=150 MHz, just for a little example, but many
mistakes can be spotted directly on the schematic.

I though so also, but this beast has only one mixer for RX and TX and
RF/IF ports are exchanged from RX to TX. This migth be a problem or not,
but if it worked at 50 MHz with 1N4148s it will work on 70 MHz with

1N5711 (maybe even reasonably well with 1N4148, but diodes are cheap anyway).

Of course my own transverters are much better, I started from well known and working schematics. I've been asked to modify this one just because the owner isn't going to get active on the new band if he has to spend much more than a bunch of parts. Having as many new station QRV as possible is good, the nearest 4m station to my QTH currently is at a bit less than 500 Km and that's after two years that we have had temporary permits.

Thanks for suggestions, I probably will try with a simple BJT oscillator, I was just a bit worried by the unknown collector load, I don't have any info on T4. I would need to remove and test separately with a signal generator.

best regards
Frank IZ8DWF

The mixer is indeed wrong. Only one diode is 'correct'.
To correct the circuit, you could take D8 as the 'correct' diode.
D6 - reverse.
D5 - connect anode to D6 cathode.
D7 - connect cathode to D6 anode.

I have created a tutorial on the convolution integral. It uses an
interactive flash program with embedded audio files.

It is located here:

http://www.fourier-series.com/Convolution/index.html

Brent,

Just wanted to thank you for preparing all your Flash tutorials.
Really helps to get insight into these topics. I wish I had these
when I was struggling in Electrical engineering classes.

Have a great New Year - Roger

Season`s greetings to all...
While in England in `91, I picked up a Ford motor car radio receiver.
P21 79GB-18K810  HA .   Two band , LW & MW .. (166 KHz - 285 KHz LW
&  666KHz  - 1500Khz MW  +/- ) .I would like to extend the LW band as
high in frequency as i can , and the MW band as low as i can in
frequency..I.F. is 465 kHz...Object : To create a beacon ( 200KHz -
400 KHz ) receiver...
Is there anyone out there that has any experience , and or ideas with
what i have in mind ?

TIA   Gene   WB7NGI

Hi Brent,
maybe I am missing something.
The 1-D convolution outputs that you show don't seem quite right?

Brian W

If analog tuning then you add or remove capacitance to each LC and hope that the padding can be adjusted or supplemented enough so that everything (mixer and front end) tracks. It won't be so much "extending" the tuning range but instead will be "shifting" the tuning range.

If digital tuning then you'll have to locate the schematic for the PLL chipset and see if you can convince the local oscillator to shift far enough. With some PLL chipsets there are programming pins or diodes that set the allowed range. In many cases, if you don't need the original tuning range, you can patch in a divide by two or just change the reference oscillator. If you change the reference oscillator then the display won't be right but will be mathematically related to the actual frequency.

I collect British tabletop radios and am quite familiar with their longwave dial on tube-type analog sets (my favorite is when they do not list frequencies but only wavelengths) but am not particularly familiar with British car radios. My one piece of advice with respect to car radios from foreign autos of 70's vintage or older, is to check carefully WRT 6V or 12V and WRT to negative ground or positive ground.

> could you be more specific?

When I examined the convolution of a sine wave and a pulse, the
trailing part of the output waveform after the pulse was processed,
seemed to have a random component od small amplitude round zero.

Brian W

I am sorry, but I don't see it. I can say that sometimes you have to push the slider kind of slow to catch all the points. If the slider is pushed too fast the program interpolates the points that were missed.

I believe you have identified the issue: selecting pulse (That's the wider one) and freq2 (that's the higher f), then if I pull the slider too fast, the trace is jagged - which is as you say like hopping over samples.... Pulling the slider SLOWLY fixes this right up!

Thanks

Brian W

Many years ago a friend of mine was repairing a Heath SB200 linear he had picked up. The antenna relay needed work and he was replacing the stupid RCA connector in the input side of the rig with an SO-239 (why did Heath use those RCA connectors for the antenna in all their ham rigs?).

Anyway we were talking about how the linear improved the transmit signal strength, but did nothing for the receiver and he wanted to also build a small receiver preamp to put inside the linear cabinet, and we both got the samw brainstorm, at the same time. Why not wire the linear up so it would work in BOTH directions? I suppose a grounded grid preamp using tubes with a combined plate dissipation of some 300 watts seems crazy, and one's first though would be "you'll blow up the receiver!". But remember that those tubes have a power gain of only 13db and that's about the same as a 6BA6 rf amp tube. Of course the noise figure of the 572B as a preamp probably isn't quit as good as a 6CW4, but you won't notice it much on 20 meters. Also at the signal levels we are talking about the usual cutoff bias for the tubes STILL leaves them in class A for use as a small signal preamp!

To make a long story short, we wired the relay up so it would do the required switching and tried it. The linear did boost received signals by about 13db, just as we expected. Made a difference in the DX contest!

Internally most of the good AM car radios I've met had mechanically
ganged slug tuning, although variable capacitor tuning existed too.

That's great if you're comfortable adjusting the mechanics of the
radio internally to get the tracking right. Remember, you won't be
broadening the tuning range, you'll be shifting the tuning range.

Tim N3QE

� guess by about 1990 (20 years ago) they had all abandoned the
slug-tuned stages.

I had a '90 era car radio found in the Caribbean.  It locked onto the
9kc European channels.  I'm sure there was some chip jumpering that
would allow tuning to American 10kc channels but I never could find the
info.

Try 1000 watts for the combined plate dissipation.

```

The 572B actually had only 150 watts plate dissipation and the SB200
used two of them.  The T160L version of this tube had a 160 watt plate
dissipation.  Many SB200's grossly overloaded these tubes and got away
with it.
```

>>> and one's first though would be "you'll blow up the receiver!".

The odds of a pair of 572B's in grounded grid oscillating were very slim, at least at HF. VHF parasitics were another story, but the SB200 was well built in this regard. I'm sure the rig was stable even without an antenna connected. IIRC we thought of putting in a pair of back to back 1N4007's on the rig side during receive just in case.

Station monitor used but in perfect aesthetics conditions (see in
photo), there are only some imperfections due to the time.
The electronics is perfect, and the catodic ray tube works perfectly,
the item has been used as oscilloscope up to few days ago.

The auction includes:
Original box,
manual copy (or if you don't want it, it's possible to download it
here)
Kenwood SM 220

The optional BS-8 is not included

t!

There's something to be said for an amplifier with high IP3. One way
to get that is to use high-power devices in the amplifier. It's not
to hard to find modern solid-state devices with fairly high power
dissipation and also low noise figure. One of the obvious problems is
that such an amplifier may have the potential to blow up things
following it...

Ulrich Rohde published an article in Ham Radio magazine some thirty
years ago about a way to get a good noise figure and extremely good
IP3 in an amplifier; his example was based on CATV transistors of
modest dissipation. The article seemed to leave quite a bit to the
imagination of the reader, and I've never seen any commercial products
that come close to the performance he suggested should be possible --
not even from the company in New Jersey of which he's a director. I'd
be really happy to find such an amplifier just now... (NF ~ 2dB, TOI >
+70dBm, on the order of a watt bias power, per Rohde).

Cheers,
Tom

ONLY IF the amplifier is allowed to become unstable.  It can't generate
any more power output than the input signal multiplied by the power
gain, so unless a KW station a few hundred feet away fires up you're safe.

I've seen preamps using 2n3866 transistors (sometimes TWO in push-pull)
which come close to meeting this description.

Well...that depends on what the following stages can tolerate, the gain of the amplifier, and the signal environment you're in. I know that European AM broadcast stations in the 7MHz band can put signals into the East Coast of the US that deliver 0dBm to the output of some hams antennas, and from what I hear, listeners at many locations in Europe have to deal with even larger signals. When the phases of such signals all line up, the peak voltage can be substantial. It's at least something to beware of.

Do you happen to have any more definite references to preamps with very high TOI? I've had trouble finding anything better than about +56dBm in commercial amplifiers that don't also draw several watts (or more!) quiescent. What I'm looking for needs to be broadband, 500kHz--30MHz.

Cheers,
Tom

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

I once broadened the band of a Titan 4 reciever by
adding a varible capacitor with a spst it might need another varible

capacitor with a spdt to get the other end of the spectrum.

Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

Hey OM:

The only way to make that work is with a converter.
Back in the day before police scanners, I made a converter that
converted the 70cm police band down to the AM broadcast band. 530Khz
thru 1600Khz was the band back then. My converter could put 3 local
police frequencies on the AM band.
All the converter is is an LO, input tank circuit, and a mixer. The
only active component was the LO. I used a CB rock which were dirt
cheap. Caught the 70cm harmonic into the mixer, getting the police
band down to the AM band.

I made a version that plugged inline with the car antenna and the car
radio, that could be switched in and out.
I couldn't make enough of them, Was the best selling product I ever
made.

73 OM

Raypsi

You cant find the specs on a converter anymore!
I probably used one of your gadgits back in the 70s, the car am radio was converted to cb band!

My titan 4 reciever had a trimmer just above the vfo to zero its frequency with the dial reading!

I simply put the trimmers center point to a toggle switch that led to two other varible capacitors and could go up or below the cb band, tuning each to a specified value!

I would love to be able to get a converter to fill in the gaps on a ubc 780 xlt.
A converter to allow it to start at 100 hz and go to 4 gigs will be your next best seller without having to use the pc software;)

How did that work?  Wasn't the police band using FM back then like they
```

do today? I suppose the RF signal may have had enough "AM" component
perhaps?

It is easy to detect FM on an AM radio by using slope detection. Not the
best way, but it works.

Hey OM:

Yeah, a converter to gets the blocked cell phone bands. They making
those things in some ones garrage in Hong Kong.
Naw the top selling device would be a cell phone jammer. Flick it on
and all the cell phones within a certain radius go down.
A jammer would be highly illegal though, even a police converter
nowadays would be the same: illegal.

No the police bands are wide open they dont use digital because of the
range. They all still use analog because of its dependability!

They do use cell phones to communicate privately on digital,but theirs
still that problem of 40 kz between transmit and recieve to over come.

That only got you a dependent pimp or drug dealer.The cordless phones
are still of interest however,the scanners that can get into the
2-4gigs are too expensive for the ordinary joe<I;-)

In Britain the police is now on a digital nation wide trunking system
,originally called Tetra ; I believe it is a Motorola system .
The Ambulance- and other public services are gradually also adopting the
system ,which eventually will be pan-european .

99% of all the cordless phones are now digital (mostly 900MHz)
Many are of the DECT type (Digitally Enhanced Communication Technology)
Those cordless phones which are GAP compatible (even when from different
manufacturers) can be used with the same base station (unit wired to
the telephone system)

Maybe in the US they are. In the rest of the world, and many sold in the US,
use the 1.8gHz band. The low end of the US 1.9gHz band overlaps the high
end of the 1.8gHz band used elsewhere, so they can be 1.8 gHz here and
1.9 gHz there. :-)

There are some 2.4gHz cordless phones, but AFAIK they are slowly being phased
out because the poorly designed ones interfere with WiFi, and the good ones
that look for a clear channel can't function in a heavy WiFi environment.

5.8gHz phones, only legal in the Americas, are similar to their 2.4 gHz cousins
and eventually as the 5.8gHz gets taken over by 802.11n networks, they too
will disapear.

BTW, GAP phones are not always useable with other base stations. In order
to access a base station a handset must register with it, and currently that
has to be done by placing both the handset and base station in registration
mode and inserting the handset into the base station. Works in theory, but
every manufacturer uses a different base design and they contacts won't mate.

Geoff.

We now have a 6.2 ghz cordless! Digital cell phones are only good to reach the nearest microwave tower then then the signal is relayed! This is most likely the way the Europeans use digital as it's no good over a distance of 30 miles without being relayed.

The only bennifit of digital is a weak signal demanding cable or satellite subscriptions$$$$

To amplifi the digital signal enough to be usable at greater distances will have a domino effect on its technology of being deadly due to exposure to microwaves to the human brain and redering one impotent!

http://www.articlesbase.com/technology-articles/the-harmful-effects-of-cell-phone-use-413085.html

This release of harmful cellphone use will hurt the industry or do
away with it completely!!
$$$

There is no "inserting in the base station" during registration of a
handset with a base station. You only select some function, key-in some

number, and press some button.
My base station does not even have the facility to charge a handset,
there is a separate charger base for that.

In the Netherlands it has been active for several years already.
There is no more police radio snooping using FM scanners anymore.

(of course this means the public cannot serve as an extra eye and ear
to the police anymore, either)

=====================
That's correct. My Philips system does not need inserting ,it is like
Rob describes . Any GAP compatible DECT phone can be registered (up to a
certain maximum number per base station)
I have checked the range (max distance between base station and any
handset) . In open country (no buildings or other line of sight
obstructions other than 1 building wall) the range is not less than 100
metres.

Does anybody have an old large panel meter (case inside dia of 3"). The
meter can (should) be broken as all I need is the outside case. I need
a bezel for a 3" CRT and a case from a broken panel meter with a 3"
(inside) diameter would work fine.

Hi all,

I'm enquiring on behalf of a friend. He's looking for an MC145106 PLL IC.
Does anyone know where he could buy one from in the UK?

Thanks,

JOHN, M5AML

www.wells10000.plus.com/m5aml/

Hi

I am currently interested in restoring an old well-constructed homebrew exciter which was built in the 50's from (I believe) an ARRLhandbook design. It has a 6AG7 (osc) , 6V6 (doubler/tripler), 807 (PA) lineup with clamp tube protection on the 807. It was intended to drive an 813 amplifier as far as I know. It appears to have been used mainly on 15, 20 and 40m and is crystal controlled. It was last used about 30 years ago but is in good overall condition and the quality of the components used appears to be good.

I would appreciate any data on this design, particularly circuit information. A pointer even to the original handbook article would be of value.

Thanks in advance for any asssistance.

Gerry/EI9FV

The rig you are talking about is on page 192 of the 1951 ARRL HB.
The tube lineup is 6AG7 osc-doubler, 6V6 multiplier, 807 final, 6Y6G
clamp tube.  This chassis was then link coupled to a second chassis with
a pair of 813's in push pull.

In the 1952 HB there is a similar rig without the 807, the 6V6 drives a
single 813 and the 6Y6 is the clamp tube for the 813.

It is possible that the design also appeared in QST.  The rig from the
1952 HB may well be:
    "Building an 813 Transmitter--Modern Style", by  R. Smith, W1FTX,
QST, July 1951 pp 11-17.

I did not find a QST article for the rig described above from the 1951
HB.  That does not mean that it does not exist.

LOT of TEN or Singles.
Minicircuits ZKL-1R5 [ZKL1R5] RF MICROWAVE AMPLIFIER(s), Wideband 10MHz-1.5GHz.
High-end Amps, MedPower +18.7dBm, LowNoise 3dB, Gain 39-40dB. NEW - in original Minicircuits/antistatic packaging (never used, USA origin & location, ships worldwide).
Either Singles or entire LOT (price shown for a Lot, but message us if you want single(s) - shipping is CHEAPER than shown ($5.20), etc. however on a quantity basis you save by dealing as a Lot, not Singles - message us if you just need a few, not all 10 units).

Posted on Ebay, item# 330371507322 - goto www.ebay.com & enter 330371507322 into search. "BuyNow" OPTION is AVAILABLE - NO need to wait for Auction ending.
Contact via Ebay (best) or Email. By Email, can hit "Reply" in Newsgroups but REMOVE "nospam" strings if appears in my address (edit address manually, but sometimes it=92s already done) so I could respond from a real address/name. Do NOT reply on Newsgroups (I posted here, but will NOT read), and if I get much spam that address will be DISABLED, so you'll have to communicate via Ebay (which, incidentally, is more secure anyway). My Ebay feedback is 100% positive, not to mention 14 YEARS of Newsgroups trading without complains. Again, description is on Ebay but a few facts are copied here (for convenience):

** TECHNICAL SPECS:
A DATASHEET PDF is at manufacturer's site www.minicircuits.com-->enter "ZKL-1R5" into search--> datasheet (do not omit dash, ZKL1R5 instead of ZKL-1R5 will result in an error); so only a few specs are copied below. Finally, check the price Minicircuits is asking - $150/unit, we're asking $39 "auction start" & $56 "buynow" options - new/sealed units but @33% cost (reason to sell is explained below)
** PHOTOS are at EXTERNAL SERVER (as I CANNOT POST on EBAY for free beyond 1st free photo); at http://photos.starium.org ----> select Gallery named "Minicircuits ZKL-1R5"..
=95 Wideband, 10MHz to 1.500 GHz
=95 IP3 +31 dBm typ.
=95 LowNoise 3 dB typ. (not bad for a MedPower amp, rather than dedicated LNA)
=95 Gain 40 dB typ., Flatness 1.2dB
=95 VSWR IN 1.4, OUT 1.6
=95 P1dB Compression Point +15dB min, however charts indicate 17.6 to 18.7dBm
=95 Connectors - SMA (50 Ohm impedance), gold-plated.
=95 DCpower +12V nom @115mA max, but will take a range of 9-13V or wider.

=95 More data, plots, etc. are in a datasheet (PDF) downloadable from manufacturer's website.
Example of applications: communication systems e.g. cellular, satellite distribution, GSM/ISM; Radars, we're using them in a Middle-Stage Amplifier block in an MRI (magnetic) scientific instrument.

** REASON to SELL::
Our RF Engineer has changed Product design in which this amplifier was previously used (a scientific instrument); so not all purchased lots of ZKL-1R5 could be finished before new design "kicked in". In the new design, ZKL1R5 overloads the newly designed next amplifying stage (which became more sensitive) & we don't know a clean way to attenuate ZKL1R5's gain (38-40dB!, lowering powersupply is not a solution & not enough). So instead we switched to using ZFL-500 amps with lower gain & narrower bandwidth (0.5Ghz, in fact all we need is 0.2GHz, not even 0.5GHz). Minicircuit's policy is not to take them back & it's laborious to try to retrofit these into a new system - it's better if we simply sell, at a loss or not, but it's easier. We're already stocked on 60 ZFL-500's, so design change is permanent/verified.

I, in fact, come from a competing RF company (not to be mentioned) so not interested in promoting Minicircuits, but this is one of Minicircuits better models; as far as I know it's using Gallium/Indium PHEMT/etc. FET=92s or something to that effect, not surprising but $150 price is already difficult to attain, yet we ask even 3-4x times less or to exchange for ZFL500 (Minicircuits said =91no=94). It's a pity at the new company where I moved in 2008, which is using RF Amps (not designing them), we cannot use ZKL1R5 due to gain excessive for a new design (was normal in an older design), also we decided don't need 1.5GHz expensive amps considering our signals are under 200MHz.

P.S. Again, more photos are at that http://photos.starium.org site - pictures are better than a lengthy verbal description.

I'm using the wein bridge to generate audio tones that are fed to the transmitter for digital radio communication (basically a homebrew ASK radio modem). I'd be open to using that, but I'm not aware of any radio modems that output square waves.

This oscillator also has 2 digital pots attached: 1 to trim the space tone, and 1 to trim the mark tone. There's a high speed switch between the two pots to rapidly switch between mark and space tones. I could use this same setup with a 555 and trim the resistor to vary the pulse duration, but I'm not sure what impact a square wave would have on transmission, reception, decoding, etc...?

Has anyone heard of a square wave being used as an audio tone for digital radio communication?

Thanks in advance,
Dave
